Environmental Quality Department Technical Report 2020-05

## **Acknowledgements**

The Indigo Team of the MWRA's Department of Laboratory Services (DLS) supervised by Laura Ducott and consisting of Eric Sanderson, Caitlin Chafee, Elmire Hilaire, Tim Heckmann, Renee Angelo, Julia Wallace, Bryan Burton, and Jason Rodenhiser collected nearly all the samples, collated the physical data, and did all the microbiological analyses for this report.

Special thanks go to both the Indigo Team and additional DLS staff (Julia Japarov, Keith Stocks, Jeanette Spero, Conor Donovan, Megan Levesque, and Kristin Coombs) for post-storm sampling on weekends.

The DLS Red Team supervised by Charles Blodget conducted the nutrient analyses.

Wendy Leo, Doug Hersh, and Fang Yu of Environmental Quality were a great help on the data management end.

Special thanks to former MWRA employee Kelly Coughlin for setting up many of the analyses used in this report.

## 1 Introduction

This report summarizes data collected as part of the Massachusetts Water Resources Authority (MWRA) combined sewer overflow (CSO) receiving water monitoring program, and is produced in accordance with the variances for CSO discharges to Lower Charles River/Charles Basin and the variances for CSO discharges to the Alewife Brook/Upper Mystic River Basin. The Massachusetts Department of Environmental Protection (MADEP) issued those initial variances in October 1998 and March 1999, respectively. In August 2016, MADEP extended the variances through August 31, 2019. On August 30, 2019, MADEP issued new variances for the Lower Charles River/Charles Basin and the Alewife Brook/Upper Mystic River Basin with a five-year term, running until August 31, 2024.<sup>1</sup> EPA Region 1 approved these variances on May 31, 2020. These new variances are largely similar to the previous variances with regards to water quality monitoring and reporting conditions. This monitoring summary is submitted pursuant to both the old and new variance conditions and provides an assessment of water quality in 2019 in the Charles River, Upper Mystic River, and Alewife Brook, which benefitted from some of the 35 CSO projects in MWRA's Long-Term CSO Control Plan (LTCP), and are affected by any remaining CSO discharges.

Receiving water quality results in the report reflect the changes in the monitoring program made by MWRA in 2016 and 2017; in short, a switch to more storm-based sampling with the addition of weekend sampling to close temporal data gaps. Sections 2.1.1 and 2.1.2 describe this in more detail. An important consideration when looking at the data – especially data that are not aggregated by rainfall condition (e.g., Tables 3-6 and 4-6) – is that considerably more post-storm, wet weather data were gathered starting in 2018 than previously. For example, Tables 3-4 and 4-4, which break down visits to the sampling stations in the Charles River and Mystic River/Alewife Brook by rainfall condition, reflects this wet weather bias. More wet weather data mean more samples with higher counts of indicator bacteria, which can skew some results and trends. Where MWRA believes that the more extensive wet weather sampling has biased the data, it is noted. Finally, where the data are broken down by rainfall category, most rain data now come from more local rain gauges rather than the Logan Airport gauge. This provides more spatially relevant rainfall data, rather than using a single rain gauge that can be several miles distant from some of the sampling locations.

As part of the Boston Harbor Case (U.S. v. M.D.C, et al., No. 85-0489-RGS), MWRA developed and implemented its LTCP, which addresses CSO discharges from CSO outfalls hydraulically related to the MWRA sewer system and member community sewer systems. The LTCP consists of 35 CSO control projects, the last of which were completed and brought into operation in December 2015. Pursuant to the federal court order in the Boston Harbor Case, MWRA was originally required to perform a three-year CSO post-construction monitoring and performance assessment from January 2018 to December 2020 and submit the results to the United States Environmental Protection Agency (EPA) and the MADEP by December 2020. MWRA commenced its three-year CSO post-construction monitoring and performance assessment in November 2017. In July 2019, MWRA requested, and was granted, an additional year to complete the CSO

---

<sup>1</sup> Sanitary Sewer Overflows & Combined Sewer Overflows. <https://www.mass.gov/guides/sanitary-sewer-systems-combined-sewer-overflows#-2019-charles-river-basin-and-alewife/upper-mystic-river-final-combined-sewer-overflow-variances->

post-construction monitoring and performance assessment, so that it had ample time to complete the required receiving water models added to the performance assessment by a 2019 agreement with EPA and MADEP. The goal of the MWRA's CSO post-construction monitoring and performance assessment, which will now conclude in December 2021, is to demonstrate whether MWRA has achieved the levels of control specified in its LTCP.

In 2006, MADEP agreed, as part of the Boston Harbor Case, to issue a series of three-year variance extensions through 2020 with no additional CSO obligations and related construction activities beyond the then-approved LTCP, to allow MWRA to complete implementation of its LTCP and three-year CSO post-construction monitoring and performance assessment. The new five-year variances issued on August 30, 2019 give MWRA a longer term to complete additional CSO control planning for the Lower Charles/Charles Basin and the Alewife Brook/Upper Mystic River Basin required by the new variances.

Variance conditions require MWRA and the municipalities with CSOs discharging to variance waters (Cambridge and Somerville<sup>2</sup>) to continue to implement the Nine Minimum Controls of EPA's National CSO Control Policy, and require all of the CSO permittees to report estimated CSO discharge frequencies and volumes from their respective outfalls to these receiving waters on an annual basis. MWRA is also required to continue its receiving water quality monitoring program and submit an annual report to MADEP and EPA assessing the impacts of CSO discharges. This report is submitted pursuant to the latter requirement. The new variances issued on August 30, 2019 include the requirement of rapid notification of the public within four hours of a CSO discharge, and evaluating additional CSO control measures.

The variances, as well as the terms for extending the final CSO post-construction monitoring and performance assessment report to December 2021, also require MWRA to develop receiving water quality models for the Lower Charles River and the Alewife Brook/Upper Mystic River. MWRA, in conjunction with MWRA's consultant for the CSO post-construction monitoring and performance assessment, AECOM, is in the process of collecting data and developing the two models.

Since the beginning of MWRA's CSO control planning efforts in the late 1980s, MWRA and the CSO communities have eliminated or virtually eliminated (i.e., achieved 25-year storm level of control, specifically for the South Boston beaches) CSO discharges at 40 of the 84 outfalls addressed in the LTCP. The completion of the CAM004 Sewer Separation project by Cambridge and MWRA in December 2015 closed the last of the 34 outfalls recommended for closure in the LTCP.<sup>3</sup> MWRA and the CSO communities have also greatly reduced CSO discharges at the 44 outfalls that will remain. Along the Charles River, ten CSO outfalls were closed (including two that are closed pending additional evaluations by the City of Cambridge) and eight untreated and one treated CSO outfalls remain active. Along the Alewife Brook, seven CSO outfalls were closed and six CSO outfalls remain active. Along the Upper Mystic River (Mystic

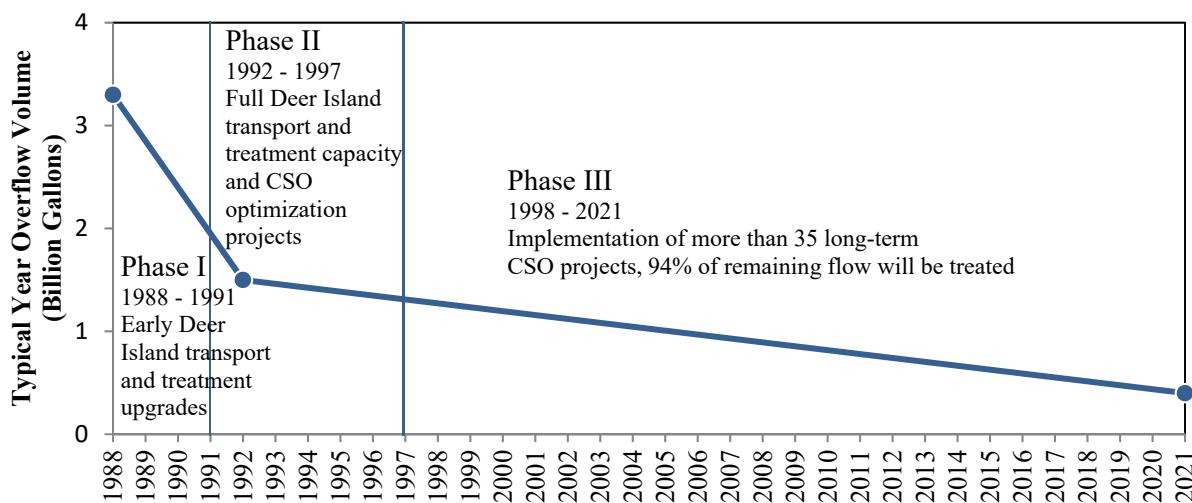

---

<sup>2</sup> Boston and Chelsea also have community CSOs, but they do not discharge into waters covered by CSO variances.

<sup>3</sup> In addition to the 34 outfalls recommended for closure in the LTCP, Boston Water and Sewer Commission (BWSC) has closed outfalls BOS006 and BOS007 in East Boston and outfall BOS072 in the Fort Point Channel; the City of Cambridge has, since 2007, temporarily closed outfalls CAM009 and CAM011 along the Charles River pending the results of a long-term hydraulic assessment; and the City of Chelsea closed outfall CHE002 in the Upper Inner Harbor.

Basin), two CSO outfalls were closed and one treated CSO outfall remains active (Somerville and MWRA jointly permitted SOM007A/MWR205A, which can discharge Somerville Marginal CSO Facility flows to the Basin during high tide). The Somerville Marginal facility primarily discharges at outfall MWR205 below the Amelia Earhart Dam in marine waters (not subject to the variance) when not restricted by the tide.

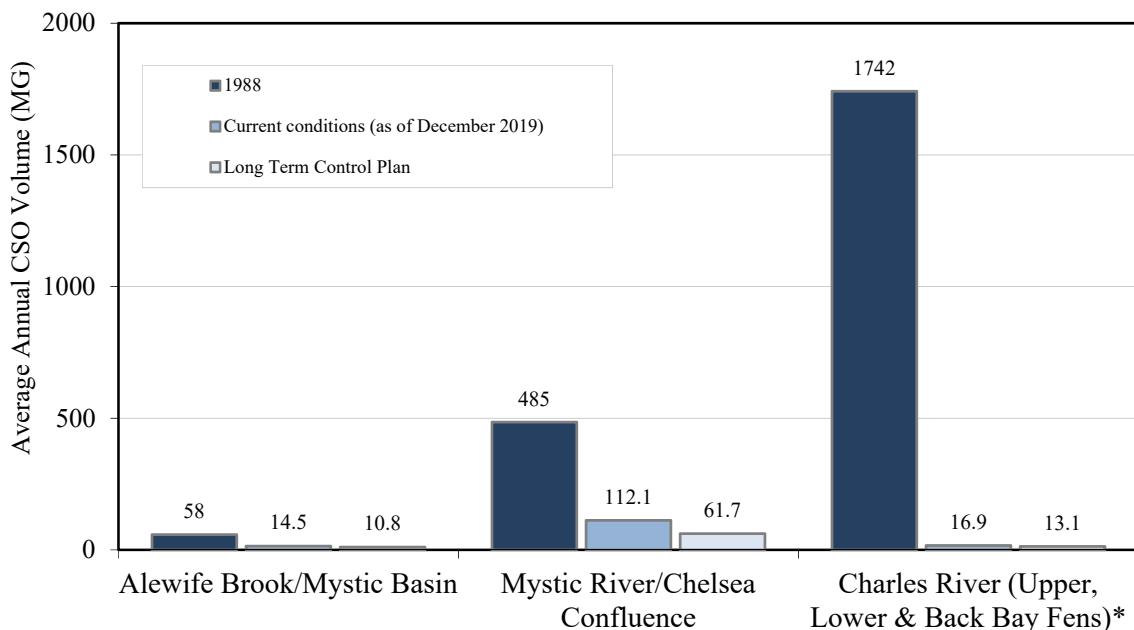

Since the early 1990s, major MWRA system improvements, such as the upgrade of the Deer Island Treatment Plant and related transport systems, and the completed CSO projects, have reduced the frequency and volume of CSO discharges and have increased the percentage of discharges receiving treatment. The LTCP is predicted to reduce region-wide CSO discharge volume in a Typical Year<sup>4</sup> from 3.3 billion gallons in 1988 to 0.4 billion gallons, an 88% reduction, with 94% of the remaining discharge volume receiving treatment at MWRA's four CSO treatment facilities. Figure 1-1 shows the estimated Typical Year CSO volume reduction system-wide since 1988, and Figure 1-2 shows the CSO volume reduction by receiving water. For purposes of this report, receiving water quality data for the past 5 years (2015-2019) is considered representative of current conditions.

**Figure 1-1. Estimated CSO volume reductions, 1988 – 2021 system conditions.**

Source: Updated from MWRA (2016)

<sup>4</sup> Typical Year rainfall was developed by MWRA in 1992 using a 40-year rainfall record and was approved by EPA and DEP as a basis for measuring the performance of CSO control alternatives and the water quality impacts of remaining CSO discharges. Level of CSO control in the Typical Year is a key performance objective of the LTCP.

**Figure 1-2. CSO Typical Year Discharge Volume Estimates for 1988, Current, and Approved Long Term Control Plan**

\* Back Bay Fens (Muddy River) is tributary to the Charles Basin but is not a variance water. Source: Updated from MWRA (2020b)

Rainfall volumes for calendar year 2019 at various gauge locations in the MWRA service area and comparison to MWRA's approved Typical Year appear in Table 1-1. The table summarizes the frequency of rain events in 2019 within selected ranges of rainfall volume. 2019 was a wetter year compared to the Typical Year for number of rainfall events (approximately 122 versus 93), while total rainfall volume was close to a Typical Year (approximately 47 versus 46.9 inches), and several inches higher than the official average annual rainfall for the Boston area (43 inches). Numbers of storms were higher than the Typical Year at all gauges for the <0.25 inch and 0.25-0.5 inch categories – at some gauges, there were twice as many storms in the latter category as the Typical Year, reflecting considerable spatial variation. For the 0.5-1.0 inch category, only the Ward Street gauge recorded more storms than the Typical Year. In the 1.0-2.0 inches category, all gauges except Somerville Marginal and BWSC Allston recorded more storms than the Typical Year. Large storms – those greater than or equal to two inches of rainfall – occurred fewer times in 2019 than the Typical Year. However, many of the storms in 2019 also had high peak rainfall intensities, which can drive CSO activations. Table 1-2 compares rainfall event relative intensities to the Typical Year using 0.4 inches/hour as a reference. (Refer to Tables 3-3 and Table 4-3 for CSO discharge estimates for the Charles and Mystic, respectively.)

**Table 1-1. Comparison of rain event frequency by rainfall volume, 2019 rainfall vs. Typical Year.**

	Total Rainfall (in.)	Total Number of Storms	Number of storms, by rainfall volume				
			<0.25 inches	0.25 – 0.5 inches	0.5 – 1.0 inches	1.0 – 2.0 inches	≥2.0 inches
Typical Year	46.8	93	49	14	16	8	6
2019 Chelsea Creek Headworks (MWRA)	49.18	116	63	26	9	17	1

### *1.1 Overview of the monitoring program*

MWRA's CSO receiving water quality monitoring program has been ongoing since 1989, with most sampling locations continuously monitored since 1991. All harbor and tributary areas affected by CSOs in Boston, Chelsea, Cambridge, and Somerville are included in the monitoring program. For most sampling locations included in this report, which presents sampling results for the Lower Charles River/Charles Basin and the Alewife Brook/Upper Mystic River only, at least 20 samples have been collected each year.

### *1.2 Organization and purpose of the report*

Chapter 2 presents the materials and methods used in monitoring. Chapters 3 and 4 discuss the results of the CSO receiving water quality monitoring program in the Charles River and Alewife Brook/Upper Mystic River, respectively. Water quality parameters examined for each region include: bacterial indicators (*E. coli*, *Enterococcus*, and fecal coliform), dissolved oxygen, water clarity (Secchi depth, total suspended solids), nutrients (phosphate, ammonium, nitrate/nitrite) and chlorophyll.

The purpose of the report is to summarize 2019 water quality in the Charles River and Alewife Brook/Upper Mystic River. The report compares sampling results to water quality standards, and shows spatial and temporal variations in water quality, and differences between wet and dry weather. For some bacterial and physical parameters, data from the previous five monitoring years are analyzed and compared with the 2019 data.

## 2 Materials and Methods

### 2.1 *Field and laboratory methods*

#### 2.1.1 Selection of sampling locations

Some sampling locations were chosen for their proximity to CSO discharges and others were chosen to provide representative water quality measurements for a given area. Typically, all samples are collected by boat, but beginning in 2017, existing stations that were also accessible from the shore were identified so sampling could continue in inclement, non-boating weather. These stations are also used for weekend sampling (see section 2.1.2 below). Complete lists of stations for the Charles River and the Alewife Brook/Mystic River, including maps and descriptions, appear in Figure 3-1 and Table 3-1 (Charles) and Figure 4-1 and Table 4-1 (Alewife/Mystic).

#### 2.1.2 Sampling schedules

At least 20 station visits were made to each location last year, within two separate monitoring projects described below. Eutrophication monitoring is conducted biweekly year-round, at a subset of river locations, and includes nutrient, chlorophyll, TSS, bacteria, and physical measurements. CSO receiving water monitoring includes bacteria sampling and physical parameter measurements that are collected roughly between April and October. Prior to 2016, this monitoring was conducted in weekly rotations for each region, with efforts made to collect approximately equal numbers of samples in dry, damp, and wet weather conditions. Beginning in the 2016 field season, regions were sampled exclusively in two-week rotations, allowing the program to capture data representing the dry weather baseline, wet weather events, and the “recovery” period in the subsequent days after a rain event. Capturing the “recovery” period after storms was given a high priority. The two-week rotations were flexible, so they could be shortened or extended to capture storm events or move to a different region to capture a storm event. In 2017, weekend sampling was added to address the data gap that might occur if a storm, or its recovery period, occurred over a weekend. Weekend sampling occurred only at the shoreline sampling locations, and only near-surface bacteria samples are collected. Due to the rarity of discharges from the Cottage Farm facility, sampling in the Charles River following discharges from the facility was given high priority. Sampling was conducted in the Charles following four of the six Cottage Farm discharge events in 2019. Targeted sampling took place in the Mystic/Alewife region following the other two major storms that caused those Cottage Farm activations.

#### 2.1.3 Sample collection

At all locations, water samples and water quality measurements were collected near-surface (approximately 0.1 meter below surface). Surface samples were collected by grab into rinsed sample containers. Bottom samples were collected at locations with a water depth greater than 3 meters, using a Kemmerer sampler or alpha bottle at 0.5 meter above the sediment surface. Bottom water quality measurements (physical measurements such as dissolved oxygen, temperature, and salinity) were made at most locations regardless of depth, but some upstream locations are too shallow for separate bottom readings. Separate sampling containers were used for bacteria, nutrient, and total suspended solids (TSS) analyses.

#### 2.1.4 Field measurements

Field measurements were made with different instruments over the course of the monitoring program. Table 2-1 lists the instruments used and the variables measured.

**Table 2-1. Field measurements.**

Variable	Instruments used
Temperature, conductivity/salinity, dissolved oxygen, turbidity, pH	Hydrolab Datasonde 4 (1997 - 2008) Hydrolab Datasonde 5 (2006 - 2008) YSI 600XL for temperature, conductivity, dissolved oxygen (1999 – 2013) YSI6600, YSI6820 (2009 – March 2019) YSI EXO2, EXO3 (April 2019 – present)
Secchi Depth	Wildco 8-inch limnological Secchi disk (upstream of dams) Wildco 8-inch oceanographic Secchi disk (marine waters)

#### 2.1.5 Rainfall measurements

Most analyses or narrative text include 15-minute rainfall data from rain gauges throughout the region which may be more local to CSO outfalls and/or monitoring locations: Ward Street and Somerville Marginal (MWRA); Allston and Charlestown (BWSC); and Fresh Pond (US Geological Survey). These data are also stored in the MWRA’s Environmental Monitoring & Mapping System (EM&MS) database. Daily rainfall measurements were also taken from the National Weather Service (NWS) rain gauge located at Logan Airport in East Boston, as this was considered the most representative location for the entire monitoring area, and data is available for the entire monitoring period. Results from this gauge are reported in one-day intervals. Data are downloaded from the NWS website and stored in the EM&MS database.

#### 2.1.6 Laboratory analyses

Samples were analyzed at the MWRA Central Laboratory. For enumeration of bacteria, chlorophyll, nutrients, and TSS, MWRA Department of Laboratory Services (DLS) Standard Operating Procedures are followed.

Detailed laboratory methods with quality assurance and quality control procedures are described in the Central Laboratory Quality Management Plan (MWRA 2020a) and the DLS Standard Operating Procedures (MWRA various).

Table 2-2 lists the analytes measured and methods used in the monitoring program. MWRA discontinued *E. coli* monitoring at marine locations in 2007 due to methodological concerns with the use of the Colilert method for marine samples, replacing *E. coli* with fecal coliform.

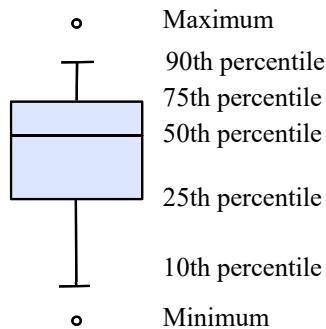

**Table 2-2. Laboratory measurements.**

Analyte	Method
<i>Enterococcus</i>	Standard Methods 9230C 2c, membrane filtration (for samples collected 1996 – 2003) EPA Method 1600 (for samples collected 1999 – 2007) Enterolert (ASTM D-6503-99; for samples collected 2007 – present)
<i>E. coli</i>	Modified EPA 1103.1, membrane filtration (for samples collected 2000 – 2006) Colilert-18 (Standard Methods 9223B; for freshwater samples collected 2007 - present)
Fecal coliform	Standard Methods 9222D, membrane filtration
Total suspended solids	Clesceri et al. (1998, Method 2540D), using nucleopore filters
Total phosphorus	TP and/or TDP: Solarzano and Sharp (1980a); PP: Solarzano and Sharp (1980a), Whatman GF/F
Phosphate	Murphy and Riley (1962), modified as in Clesceri et al (1998, Method 4500-P F) Skalar SAN <sup>plus</sup> autoanalyzer, Whatman GF/F filters
Total Nitrogen	TN and/or TDN: Solarzano and Sharp (1980b), Whatman G/F filters; PN: Perkin Elmer CHN analyzer, Whatman GF/F
Ammonium	Fiore and O'Brien (1962), modified as in Clesceri et al. (1998, Method 4500-NH3 H), Skalar SAN <sup>plus</sup> autoanalyzer, Whatman GF/F filters
Nitrate+nitrite	Bendschneider and Robinson (1952), modified as in Clesceri et al, (1998, Method 4500-NO3 F), Skalar SAN <sup>plus</sup> autoanalyzer, Whatman GF/F filters
Chlorophyll <i>a</i>	Acid-corrected (Holm-Hansen et al. 1965) as described in US EPA (1992). Trilogy fluorometer, GF/F filters

## 2.2 Data analysis

**Descriptive Analyses.** Indicator bacteria counts are typically log-normally distributed, and therefore a proper measure of central tendency for these data is the geometric mean. Geometric means and their associated 95% confidence intervals were calculated for the measurements made at each station over the sampling period.

Many results are plotted as percentile box plots, as shown in Figure 2-1. These plots present a frequency distribution of a group of measurements. Each box comprises measurements from a single sampling location. Values are shown in Figure 2-1 for the 10<sup>th</sup>, 25<sup>th</sup>, 50<sup>th</sup>, 75<sup>th</sup>, and 90<sup>th</sup> percentiles. Open circles at the top and bottom represent maximum and minimum measurements.

**Figure 2-1. Percentile distributions indicated on percentile box plots**

Box plots display the range and central tendencies of the data and allow for easy comparison of the results among stations. The 50<sup>th</sup> percentile (median) is equivalent to the geometric mean, assuming the data are log-normally distributed.

### *2.3 Water Quality Standards used in this report*

Standards are shown in Table 2-3, and include standards and guidelines from the Massachusetts Department of Environmental Protection (MADEP), Environmental Protection Agency (EPA), Massachusetts Department of Public Health (MADPH), and the Massachusetts Division of Marine Fisheries (MADMF). The MADEP standard for Class B/SB waters (fishable and swimmable) are based on *E. coli* and/or *Enterococcus* counts for freshwater, and *Enterococcus* counts for marine waters, following a USEPA recommendation for *Enterococcus* in marine waters (USEPA 1986). The MADPH issued regulations for beach management based on the USEPA criteria. MADMF uses fecal coliform to monitor shellfish growing waters. MADPH uses Secchi depth to assess water transparency at public bathing beaches and lakes. There are no public bathing beaches in the Charles or Upper Mystic/Alewife Brook, but the MADPH standard can still serve as a useful benchmark.

**Table 2-3. Water quality standards for Class B and Class SB waters.<sup>1</sup>**

Designated Use	Parameter	Standard
Inland waters (Class B) warm water fishery Massachusetts waters, MADEP	Dissolved Oxygen	$\geq 5.0 \text{ mg/L}$
	Temperature	$\leq 28.3^\circ\text{C} (83^\circ\text{F})$
	pH	6.5 to 8.3 S.U.
Coastal/marine waters (Class SB) Massachusetts waters, MADEP	Dissolved Oxygen	$\geq 5.0 \text{ mg/L}$
	Temperature	$< 26.7^\circ\text{C} (80^\circ\text{F})$
	pH	6.5 to 8.5 S.U.
Marine and freshwater primary contact recreation (designated swimming area), MADPH, MADEP	<i>Enterococcus</i>	Single sample limit: 61 counts/100 mL (freshwater), 104 counts/100 mL (marine); Geometric mean: 33 counts/100 mL (freshwater), 35 counts/100 mL (marine)
Freshwater primary contact recreation (designated swimming area), MADPH, MADEP	<i>E. coli</i>	Single sample limit: 235 counts/100 mL (freshwater only); geometric mean: 126 counts/100 mL (freshwater only)
Former standard, primary contact recreation, MADEP (pre-2007)	Fecal coliform	Geometric mean: $\leq 200 \text{ counts/100 mL}$ , no more than 10% of samples above 400 counts/100 mL
Restricted shellfishing, MADMF	Fecal coliform	Geometric mean: $\leq 88 \text{ counts/100 mL}$ , <10% of samples > 260 per 100 mL
Primary contact recreation, MADPH, aesthetics/transparency	Secchi disk depth	$\geq 1.2 \text{ meters (4 feet) at public bathing beaches and lakes}$

<sup>1</sup> All receiving water areas discussed in this report are Class B according to MADEP standards current as of December 2013 (except for Mystic River mouth downstream of the Amelia Earhart Dam, which is SB<sub>CSO</sub>. SB<sub>CSO</sub> has the same water quality standards as SB except for an allowance for CSO discharges).

#### From MADEP 2013:

**Inland Water Class B:** These waters are designated as a habitat for fish, other aquatic life, and wildlife, including for their reproduction, migration, growth and other critical functions, and for primary and secondary contact recreation. Where designated in 314 CMR 4.06, they shall be suitable as a source of water supply with appropriate treatment (“Treated Water Supply”). They shall be suitable for irrigation and other agricultural uses and for compatible industrial cooling and process uses. These waters shall have consistently good aesthetic value.

**Coastal and Marine Class SB:** These waters are designated as a habitat for fish, other aquatic life, and wildlife, including for their reproduction, migration, growth and other critical functions, and for primary and secondary contact recreation. In certain waters, habitat for fish, other aquatic life and wildlife may include, but is not limited to, seagrass. Where designated in the tables to 314 CMR 4.00 for shellfishing, these waters shall be suitable for shellfish harvesting with depuration (Restricted and Conditionally Restricted Shellfish Areas). These waters shall have consistently good aesthetic value.

### 3 Charles River

#### 3.1 Sampling area

MWRA's sampling area in the Charles River includes the river segment from the Watertown Dam in Watertown downstream to the New Charles River Dam in Boston, near the river mouth. This area, the "Charles Basin" for purposes of this report, is freshwater and designated Class B with a variance for Combined Sewer Overflows by MADEP (with the variance currently extending to August 31, 2024). The river segment is approximately 10.3 km (8.6 mi) long. The New Charles River Dam and locks limit river flow and tidal exchange at the river mouth.

MWRA monitoring locations are primarily located midstream, bracketing CSO outfalls. Boat-accessible locations were also selected near to or downstream of outfalls: at the Stony Brook outlet and CSO (MWR023), the Faneuil Brook outlet and CSO that has since been closed (BOS032, closed in 1997), and downstream of the Cottage Farm CSO treatment facility outfall diffusers (MWR201). In 2019, a shoreline sampling location (station 206) was added downstream of MWR201, in addition to the boat-accessible station 006. The addition of 206 allows for sampling on weekends or when conditions are unsafe for boating. Results for 006 and 206 are combined in Figures 3-2, 3-5, 3-6, 3-9, 3-10 and Table 3-6.

For purposes of this report, MWRA's monitoring area in the lower Charles is divided into three smaller reaches. Sampling locations and CSOs appear in Figure 3-1. Table 3-1 describes the reaches, and the sampling locations and CSOs within each reach.

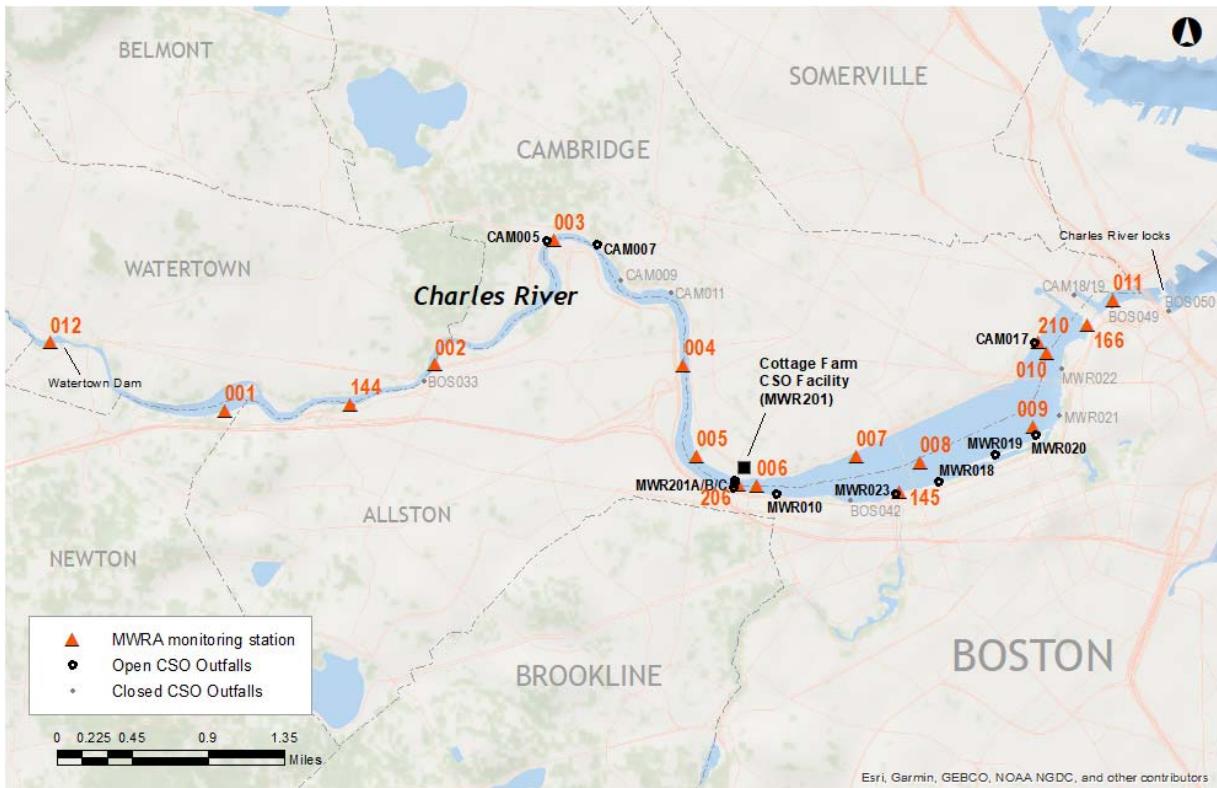

Figure 3-1. Map of MWRA Charles River sampling locations.

**Table 3-1. MWRA monitoring locations, Charles River Basin.**

Reach	Description of Reach	Sampling station	Location Description
Upper Basin (Class B/Variance, warm water fishery)	Watertown Dam in Watertown, downstream to Magazine Beach (near BU Bridge) in Cambridge	*012, Watertown *001, Newton 144, Allston *002, Allston *003, Cambridge 004, Cambridge/Allston *005, Cambridge	Watertown Dam at footbridge (upstream of all CSOs) Downstream of Newton Yacht Club (upstream of all CSOs) Faneuil Brook outlet (at BOS032, closed 11/97) Downstream of Beacon St. Bridge (downstream of BOS033, closed 10/96) Downstream of Eliot Bridge, Cambridge side (at CAM005) Between River St. and Western Ave. bridges 10 m off of Magazine Beach
Mid-Basin (Class B/Variance, warm water fishery)	BU Bridge on Boston/Cambridge line to downstream of Longfellow Bridge	006, Cambridge/Boston *206, Cambridge/Boston *007, Cambridge *145, Boston 008, Cambridge/Boston *009, Cambridge/Boston 010, Boston *210, Cambridge	BU Bridge, downstream side (downstream of MWR201) Mid-channel, sampled on the upstream side of the BU Bridge MIT Boathouse, Cambridge side Stony Brook outlet, Boston side (at MWR023) Mass. Ave Bridge, downstream side (downstream of MWR023, MWR018) Longfellow Bridge, upstream side (downstream of MWR021, closed 3/00) Longfellow Bridge, downstream side (downstream of MWR022, closed 3/00) Dock SE of Front Park, Cambridge Pkwy (at CAM017)
Lower Basin (Class B/Variance, warm water fishery)	Science Museum to North Station railroad bridge, near Charlestown.	166, Boston *011, Boston	Science Museum, upstream of old dam (downstream of all lower basin CSOs) Between Science Museum and New Charles River Dam/locks (downstream of all Charles CSOs)

Sampling locations are midstream unless otherwise noted. \* indicates sampling location is also a shoreline sampling location.

### *3.2 Pollution sources*

Known CSO sources to the Charles River Basin are shown in Table 3-2; these include nine CSO outfalls, eight untreated and one treated. MWRA's Cottage Farm CSO treatment facility, located immediately upstream of the BU Bridge, treats CSO flow (screening, chlorination, and dechlorination) before discharge, and is the only source of treated CSO discharge to the river. (MWRA's Prison Point CSO facility, located near the Charles River mouth, has its discharge point on the Boston Harbor side of the New Charles River Dam.) With increases in sewer system capacity and removal of large volumes of stormwater from the sewer system with sewer separation projects, the number of activations at Cottage Farm has decreased over the last two decades. In the late 1990s, more than 20 activations annually were common, but in the 2014-2017 period there were only one to three activations annually. As shown in Table 1-1, 2019 was a wetter than typical year, particularly in the frequency of storms with 1.0 – 2.0 inches of rainfall. There were six activations at Cottage Farm in 2019 (12 hours of discharge total), and samples were taken at available river locations following four of the six activations. (Targeted sampling took place in the Mystic/Alewife region following the other two major storms that caused those Cottage Farm activations.) The Stony Brook/Muddy River outlet near Kenmore Square is a source of contaminated brook flow and stormwater flows to the basin area, as well as infrequent CSO discharges. CSO discharge volumes to the Stony Brook were greatly reduced in 2006 with completion of sewer separation by BWSC.

Table 3-3 shows the MWRA model simulation results for CSOs affecting the Charles River Basin for 2019. Actual CSO volumes and activation frequency are available for the Cottage Farm CSO facility.

The receiving water program is designed to capture water quality in all weather conditions. Table 3-4 summarizes the proportion of samples collected in dry, damp, and wet weather. MWRA began intensively sampling storm events in 2017. Due to the rarity of discharges from Cottage Farm, the Charles was repeatedly targeted for storm sampling in an attempt to capture water quality impacts from Cottage Farm. Additionally, since Cottage Farm discharges only in the largest storms, the wet weather sampling in the Charles is mostly of larger storms. This accounts for the large portion of the samples being collected in wet weather conditions, and potentially for the greater impacts seen in the “wet” or “heavy rain” rainfall conditions (section 3.4), as well as in any presentation of an overall data set that includes 2017 – 2019 data (i.e., Table 3-5). The addition of shoreline sampling locations increased the number of sampling events, as sampling could be performed in weather conditions that previously were unsafe for boat-based sampling. This is reflected in the large number of station visits in 2019 (740) relative to the previous five years (2874 station visits from 2014-2018, approximately 575/year).

**Table 3-2. Charles River Basin pollution sources.**

Source	Upper Basin	Mid-Basin	Lower Basin
CSOs (untreated)	2 active, 4 closed CAM005, CAM007  CAM009 closed 11/07 <sup>1</sup> CAM011 closed 11/07 <sup>1</sup> BOS032 closed 11/97 BOS033 closed 10/96	6 active, 3 closed MWR010, MWR018, MWR019, MWR020, MWR023, CAM017  BOS042 closed 5/96 MWR021 closed 3/00 MWR022 closed 3/00	3 closed  BOS049 closed 7/10 BOS028 closed prior to 1997 SOM010 closed prior to 1996
CSO treatment facility (settling and detention; screened, chlorinated and dechlorinated CSO discharge)	No	Yes Cottage Farm (MWR201) activated 6 times in 2019	No
Storm drains	Yes	Yes	Yes
Upstream inputs (elevated bacteria counts upstream)	Yes	Yes	Yes
Dry weather inputs (elevated bacteria counts in dry weather)	Yes	Yes	Yes
Tributary brook or stream flow	Yes	Yes	Yes

<sup>1</sup> Pending continuing hydraulic evaluations by City of Cambridge.

**Table 3-3. Charles River Basin CSO activations, results of MWRA calibrated hydraulic model simulations and facility records for 2019 system conditions and 2019 rainfall.<sup>1</sup>**

CSO Outfall	Activation Frequency	Total Discharge Duration (hr)	Total Discharge Volume (million gallons)
<i>Upper Charles</i>			
CAM005	10	10.00	1.71
CAM007	3	3.36	4.43
<b>TOTAL</b>		13.36	6.14
<i>Lower Charles</i>			
CAM017	1	1.25	0.95
MWR010	0	0	0.00
MWR018	2	3.62	6.50
MWR019	2	2.78	3.20
MWR020	2	2.39	2.57
MWR021 (Cottage Farm Facility) <sup>2</sup>	6	12.14	41.50
MWR023 (Stony Brook) <sup>3</sup>			>0.49
<b>TOTAL</b>			>55.21

<sup>1</sup>For the untreated CSO outfalls, activation frequency, duration and volume for 2019 rainfall are from recently calibrated hydraulic model (MWRA 2020b).

<sup>2</sup>Treated discharge. Activation frequency and volume are from MWRA facility records (measurements).

<sup>3</sup>Estimated discharge volume; past modeling of the sewer system tributary to MWR023 has shown very infrequent and small discharges of CSO through MWR023, which also conveys a large amount of stormwater.

**Table 3-4. Charles River station visits by rainfall condition.**

Sampling period	Dry <sup>1</sup>	Damp <sup>1</sup>	Wet <sup>1</sup>	Total
2014-2018	25% 722 station visits	31% 902 station visits	44% 1250 station visits	100% 2874 station visits
2019 <sup>2</sup>	14% 104 station visits	31% 231 station visits	55% 405 station visits	100% 740 station visits

<sup>1</sup> Dry: no rainfall for previous 3 days; Wet: at least 0.5 inches in previous 2 days; damp is everything in between.

<sup>2</sup> 2019 samples tended to be collected in wetter conditions than the previous five years, with increased focus on sampling following large storms.

### 3.3 Summary of water quality, 2014-2019

A summary of water quality results collected during the last five years is shown in Table 3-5.

**Table 3-5. Summary of water quality, Charles River Basin, 2014-2019.**

Parameter		MADEP Water Quality Guideline or Standard	Upper Basin				Mid-Basin				Lower Basin			
			Mean ± SD	% meeting guideline	Range	n	Mean ± SD	% meeting guideline	Range	n	Mean ± SD	% meeting guideline	Range	n

NS: no applicable numerical standard or guideline. ND: no data. n: number of samples

<sup>1</sup> Summer (June-October), Winter (January-March).

<sup>2</sup> Median and standard error of the median are shown for pH, rather than arithmetic mean and standard deviation.

<sup>3</sup> MADPH standard of ≥1.2 meters applies only to public bathing beaches; there are none in the Charles River Basin.

<sup>4</sup> For bacterial data, 95% confidence intervals (CI) are provided in lieu of standard deviations. “Mean” = geometric mean for bacteria data.

<sup>5</sup> First number is the all samples geometric mean limit - compare to the "Mean±SD" column (i.e., the Mean in that column is the geometric mean of all stations in that region for the specified indicator bacteria); the second number is the single sample standard - compare to the "% meeting guideline" column (i.e., the "% meeting guideline" column is the percentage of samples meeting the single sample standard). The “Range” column gives the range of single sample results.

<sup>6</sup> Either *E. coli* or *Enterococcus* are acceptable indicators for EPA, MADEP, and MADPH to assess suitability for swimming in freshwater.

### *3.4 Water quality results, 2019*

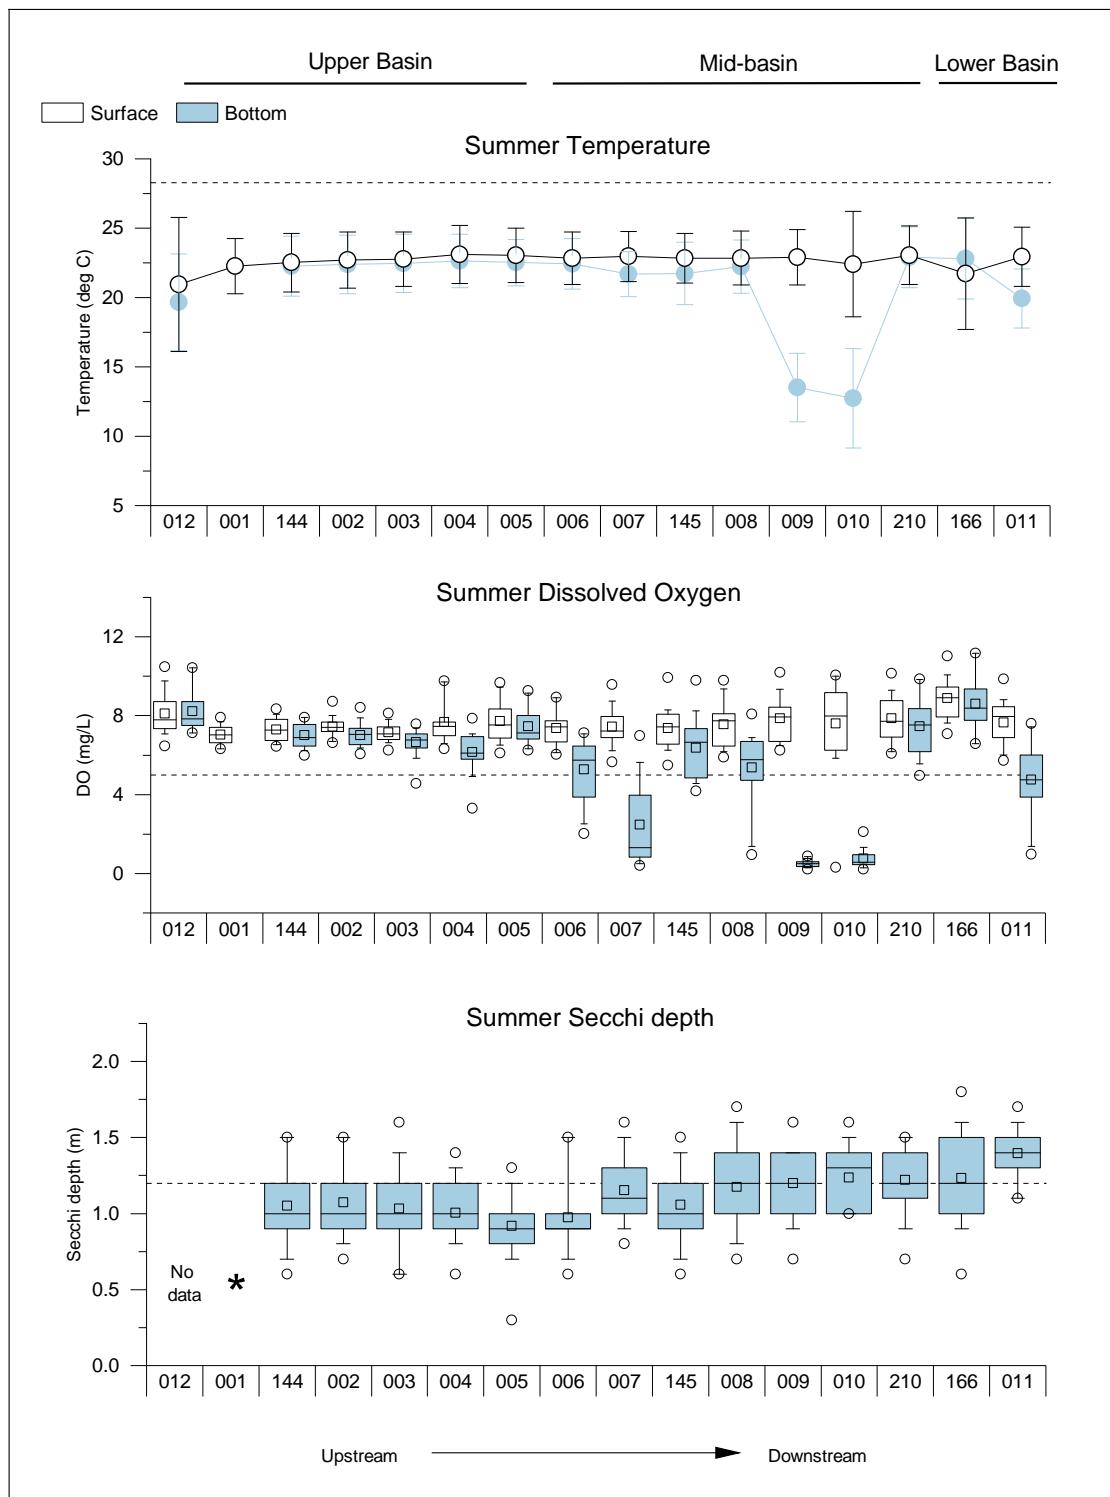

This section provides an analysis of water quality parameters measured in the lower Charles in the 2019 monitoring year.

#### **3.4.1 Physical measurements**

**Temperature.** Summer (June to October) water temperatures for 2019 are shown for each sampling location in the top graph in Figure 3-2. Surface temperatures are relatively consistent upstream to downstream. Bottom-water temperatures are lower in the deeper waters downstream near the Longfellow Bridge, particularly stations 009 and 010, where water depth exceeds 6 meters (20 to 23 feet). Station 166 is collected in a shallow location in the basin near the Science Museum, where differences in surface and bottom temperatures are small or nonexistent. Locations upstream of station 004 (upstream of the Eliot Bridge in Cambridge) are relatively shallow, with depths ranging from 1 to 3 meters.

**Dissolved Oxygen.** The spatial trend in summer dissolved oxygen (DO) is shown in the center graph of Figure 3-2. All surface water DO measurements met the State standard of  $\geq 5.0$  mg/L at all locations. While bottom DO does meet the State standard of  $\geq 5.0$  mg/L at upstream locations in the Charles, mean bottom water DO failed to meet the standard at deeper water locations downstream, including stations 007, 009, and 010. Stratification, due to salt water intrusion through the river locks and cooler bottom temperatures, results in extremely low bottom-water dissolved oxygen in the lower basin area near the Longfellow Bridge. This pattern is seen in past years as well. Station 166, downstream of the lower basin, is collected at a relatively shallow near-shore location and does not reflect the low DO levels of deeper water in the lower basin.

**Water clarity.** Water clarity is indicated by Secchi disk depth. Summer Secchi readings are shown for individual sampling locations in the bottom graph in Figure 3-2. Station 012 at the further upstream end is too shallow for Secchi measurements but is typically clear to the river bottom. Most locations in the Lower Charles had relatively similar average Secchi depths, with values slightly below the MADPH beach guideline of 1.2 meters. In 2019, most downstream stations exhibited average Secchi depths above the MADPH beach guideline.

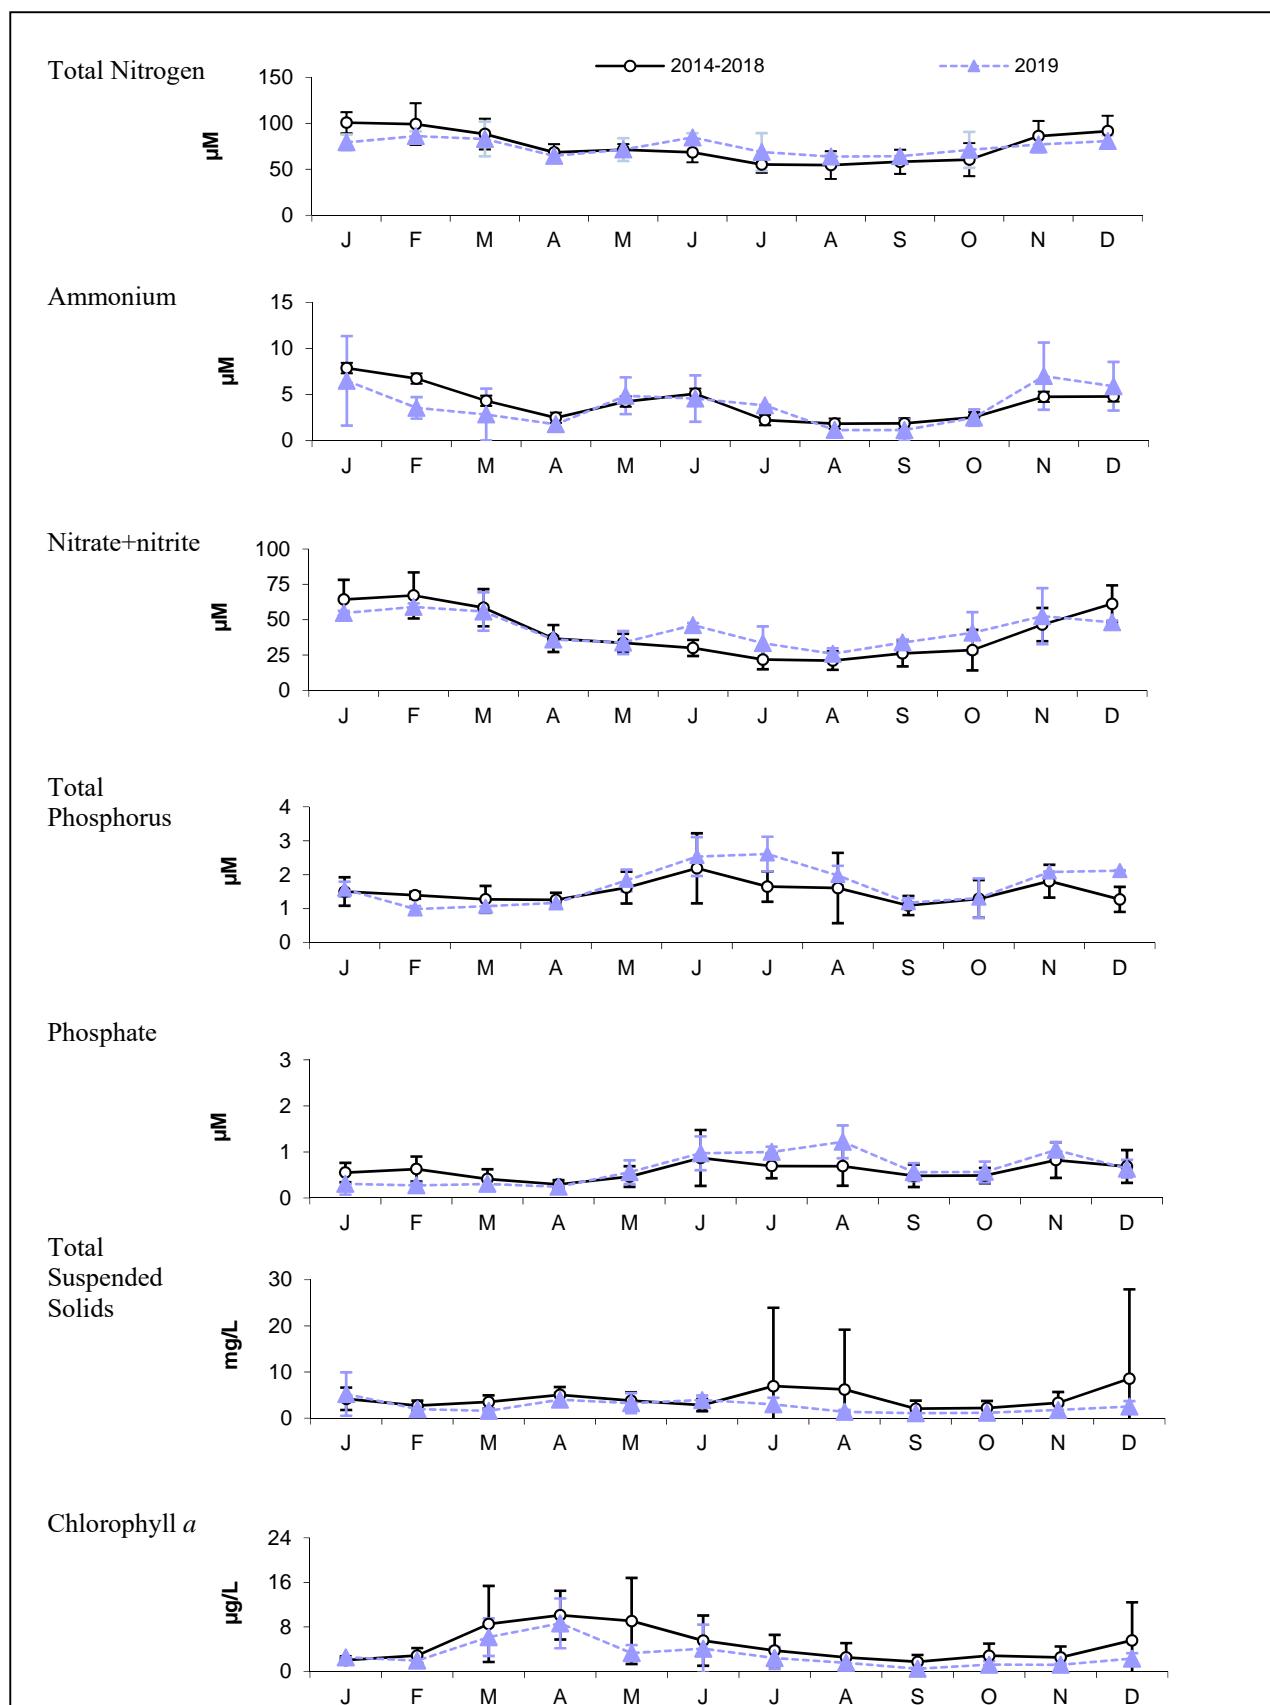

**Figure 3-2. Summer temperature, dissolved oxygen and Secchi depth, Charles River Basin, 2019.**

Dashed lines are State standards or guidelines (maximum for temperature, minima for DO and Secchi). No Secchi data are available for station 012 because of shallow depth; the bottom is typically visible at this site. Station 001 was clear to the bottom for all visits in 2019, indicated by \*. Hollow squares on the DO and Secchi plots indicate the arithmetic mean. Station 006 includes samples from nearby station 206.

### 3.4.2 Nutrients, TSS and chlorophyll

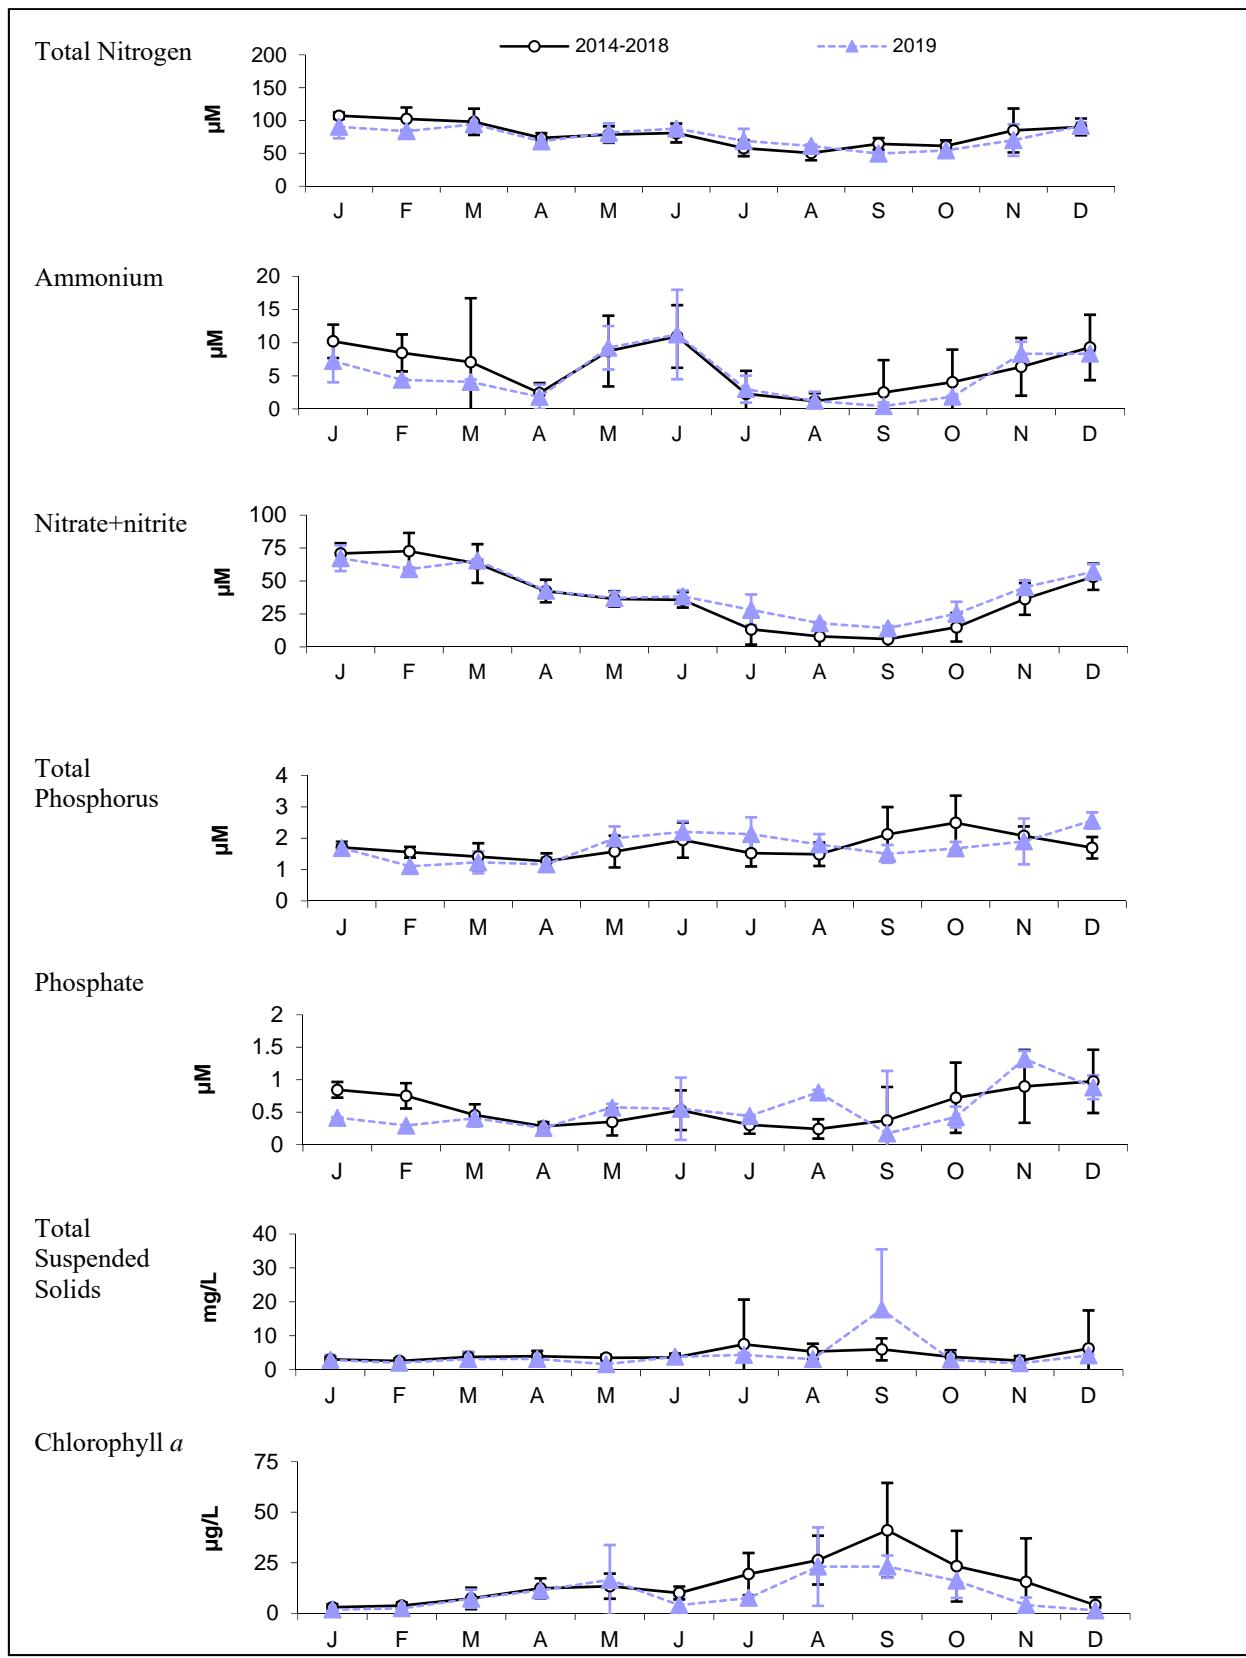

Monthly means for total nitrogen, ammonium, nitrate/nitrite, total phosphorus, phosphate, total suspended solids (TSS), and chlorophyll *a* at the upstream (012) and downstream (166) locations in the lower Charles are shown in Figure 3-3 and Figure 3-4, respectively. 2019 averages are plotted with the average of the previous five years (2014 – 2018) for comparison.

Seasonal patterns for the 2019 monitoring year were similar to the 2014 – 2018 averages at both stations, for most parameters. Total nitrogen and total phosphorus concentrations tracked closely with historical averages. Seasonal signals during 2019 were most evident for nitrate/nitrite, ammonium, and chlorophyll *a*. At both locations, nitrate/nitrite levels were highest in winter when biological uptake is low. Both locations exhibit elevated ammonium concentrations in May/June, a trend reflected in 2019 and the previous 5-year average. While the two locations showed similar concentrations for most parameters, there were differences between the two stations for chlorophyll *a*. Historically, station 012 has the highest chlorophyll concentrations in spring, whereas the Lower Basin has highest concentrations in late summer. This elevated chlorophyll *a* was evident in 2019 at station 166 in August and September before falling below the 5-year average in late fall. A large cyanobacteria bloom occurred in the Lower to Mid Basin in July/August 2019.

**Figure 3-3. Monthly average nutrients, TSS and Chlorophyll 2014 – 2018 and 2019, Station 012, Watertown Dam.**

Error bars are  $\pm 1 \text{ SD}$ . Note different scales than Figure 3-4 for most parameters.

**Figure 3-4. Monthly average nutrients, TSS and Chlorophyll 2014 – 2018 and 2019, Station 166, Science Museum.**

Error bars are  $\pm 1$  SD. Note different scales than Figure 3-3 for most parameters.

### 3.4.3 Bacterial water quality

Figure 3-5 shows the 2019 bacterial water quality at each location sampled in the Charles for dry, damp, and wet weather. The rainfall categories are derived from rainfall measured at four local rain gauges: MWRA's Ward Street, BWSC's Allston and Charlestown, and USGS's Fresh Pond gauges. Each sampling location is paired with the closest rain gauge. Upstream reaches generally have more elevated bacteria counts than downstream locations, though this trend is less pronounced than in past years. As shown in Table 3-4, wet weather sampling in the Charles River occurred more frequently in 2019 than previous years, due to enhanced focus on sampling consecutive days after storms.

The top and bottom graphs in Figure 3-5 show percentile plots of *Enterococcus* and *E. coli* counts arranged from upstream to downstream locations for 2019 respectively (note log scale). In 2019, both *Enterococcus* and *E. coli* show the historic spatial trend with more elevated bacteria counts upstream relative to downstream locations. *E. coli* counts are typically higher than *Enterococcus*, but show similar distribution spatially and in the various rainfall conditions. Within the same set of samples, geometric mean state standards (dashed lines) were met for *Enterococcus* more often than *E. coli*, particularly at upstream locations. Most stations met standards in dry and damp conditions for *Enterococcus*, but several stations in the Upper Basin did not meet *E. coli* standards in dry and damp conditions. For stations downstream of the Mass. Ave. Bridge (008 through 011), results typically meet standards for both indicators in dry and damp conditions, and occasionally in wet weather.

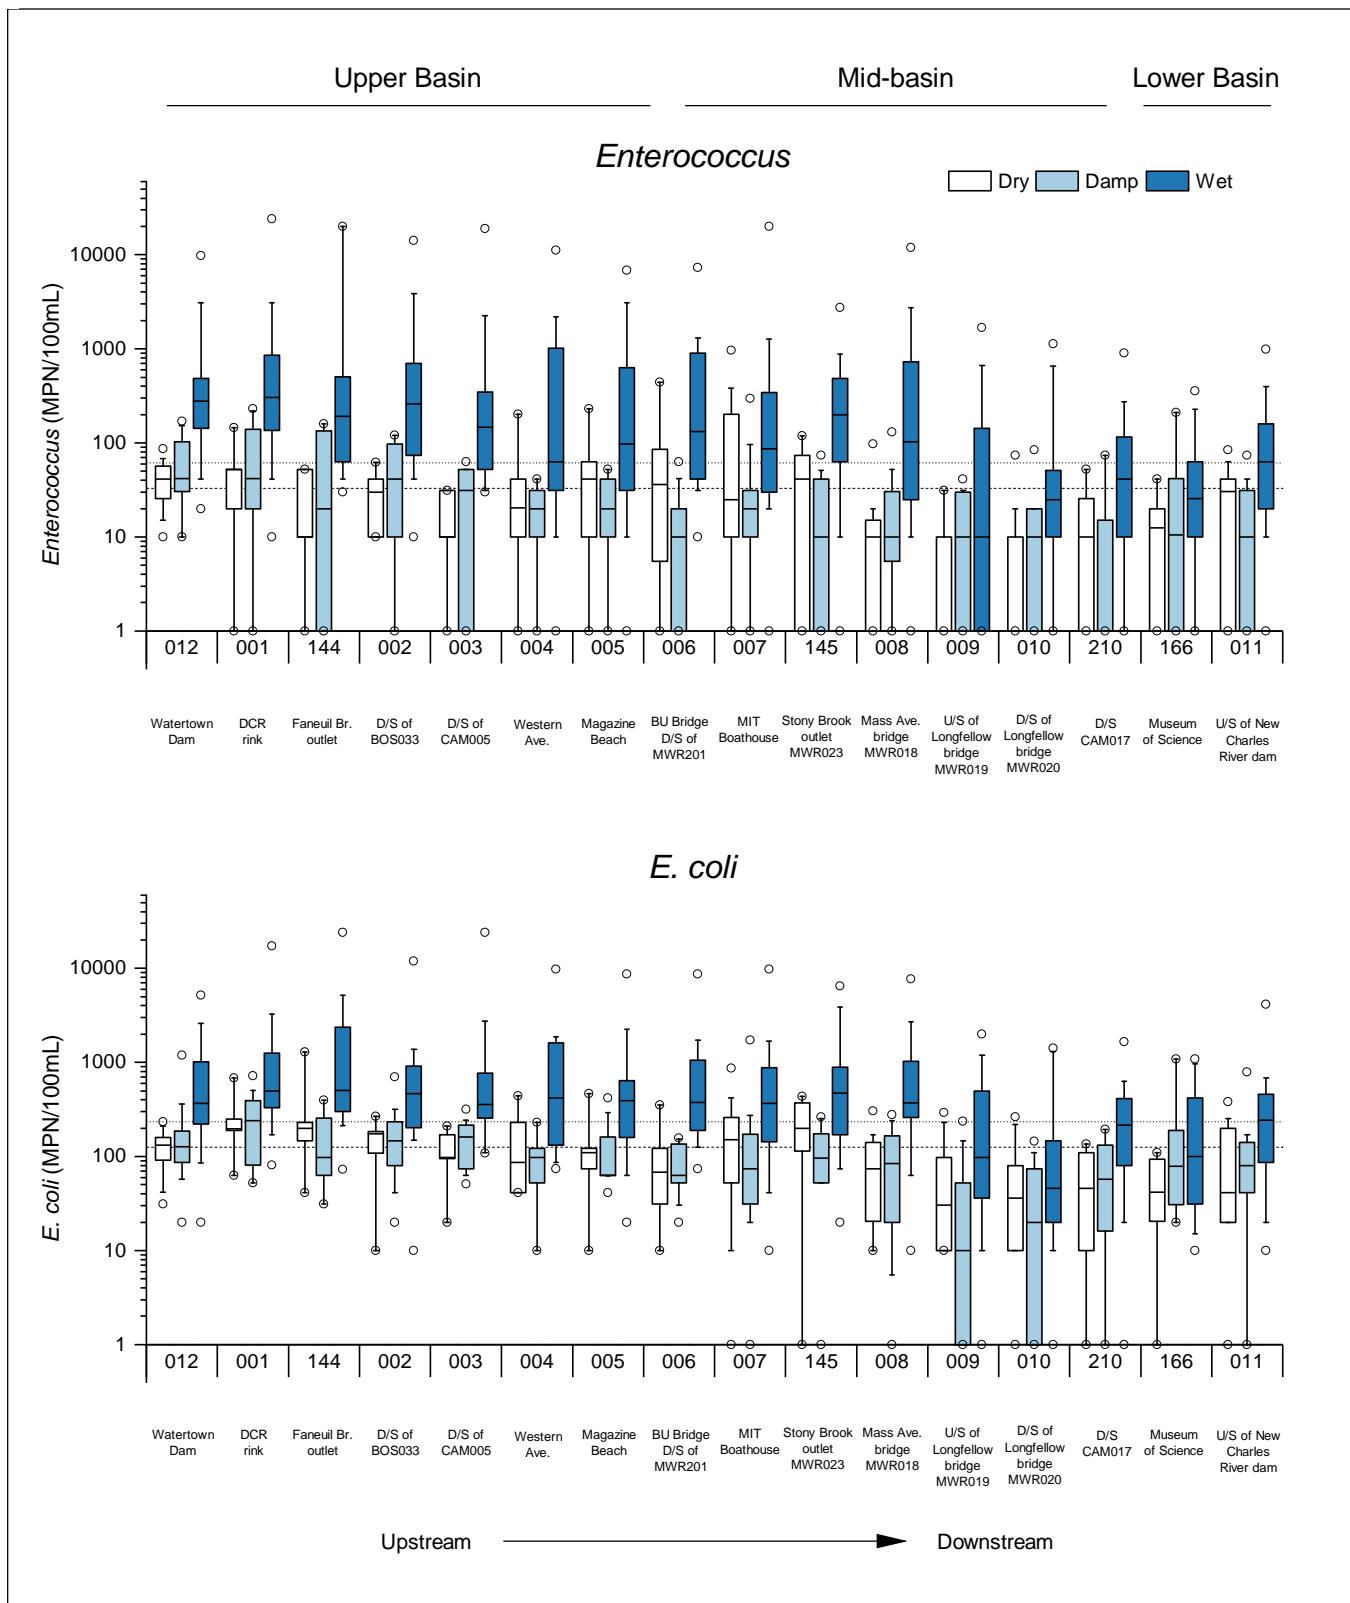

Geometric means for each location under all rain conditions for 2014 - 2018 appear in Table 3-6. Geometric means for 2019 are shown in a separate column from the 5-year geometric means. For both indicators, 2019 geometric means were higher than the 5-year mean at all locations. This is due to the increased sampling effort following heavy storms, as 55% of station visits in 2019 were conducted in 'Wet' conditions (greater than 0.5" rain in the past two days). This is accentuated in the stations surveyed by shoreline during inclement weather and weekends (shaded), which received a higher proportion of wet weather sampling than samples not sampled by shoreline. Despite this bias, annual geometric means at stations downstream of the Mass. Ave Bridge met the *Enterococcus* standard of 33 MPN/100mL.

Figure 3-6 shows the impact of rainfall on the three Lower Charles reaches on *Enterococcus* densities (upper figure), along with results for individual locations near CSO outfalls (lower figure). The upper figure shows that for 2019, bacterial concentrations in the Upper Basin were routinely higher than Mid-Basin and Lower Basin stations in all conditions. The 2019 geometric means, the line within the box, met the state standard in damp conditions in all reaches, but exceeded in heavy rain in all reaches. The lower figure shows that stations 005, 006 and 008 had elevated *Enterococcus* levels in heavy rain conditions, but met standards in dry and damp conditions. Stations 009 and 210, which are both downstream of CSOs, met standards in all conditions except heavy rain. Station 011 at the New Charles River Dam, met the geometric mean standard in all conditions except heavy rain.

The change in *Enterococcus* concentrations since 1989 in the Upper Charles Basin (upstream of most CSO influences) and the lower Charles (including the Mid- and Lower-Basin locations) appear in Figure 3-7 and Figure 3-8. Results are grouped by phases of the LTCP improvements with the last period (2014-2019) after the completion of all LTCP-related projects in the Charles. The plot includes the counts for all locations in the

Charles combined, in each rainfall condition. These figures show change over time in both regions, with significant improvement in water quality from the initial phase to the latest phase. Looking at the current phase, the Upper Basin shows improvement in both dry and wet conditions and meets the geometric mean swimming standard in dry, damp, and light rain weather, although individual high counts are still seen in all conditions. The most pronounced change is in the Middle and Lower Charles Basins, which met the geometric mean swimming standard in all conditions besides heavy rain in the Lower Basin.

2019 compliance rates with State single sample standards by weather condition are shown in Figures 3-9 (*Enterococcus*) and 3-10 (*E. coli*). Stations in the Mid-basin and Lower Basin exhibit high compliance in dry and damp weather. Stations at the widest portion of the river exhibit the highest compliance rates in wet weather, even those immediately downstream of untreated CSOs (009, 210). While the overall dry to wet pattern is clear, there are occasionally stark differences in compliance rates between the two freshwater bacteria indicators.

**Figure 3-5. Indicator bacteria concentrations, Charles River Basin, 2019.**

Dashed lines show MADEP *Enterococcus* and *E. coli* geometric mean standards, dotted lines show single sample standards. “Dry”: no rainfall for previous 3 days; “Wet”: at least 0.5 inches in previous 2 days; “Damp”: everything in between. Rainfall measured at local rain gauges. “D/S” and “U/S”: downstream and upstream, respectively. Station 006 includes samples from nearby station 206.

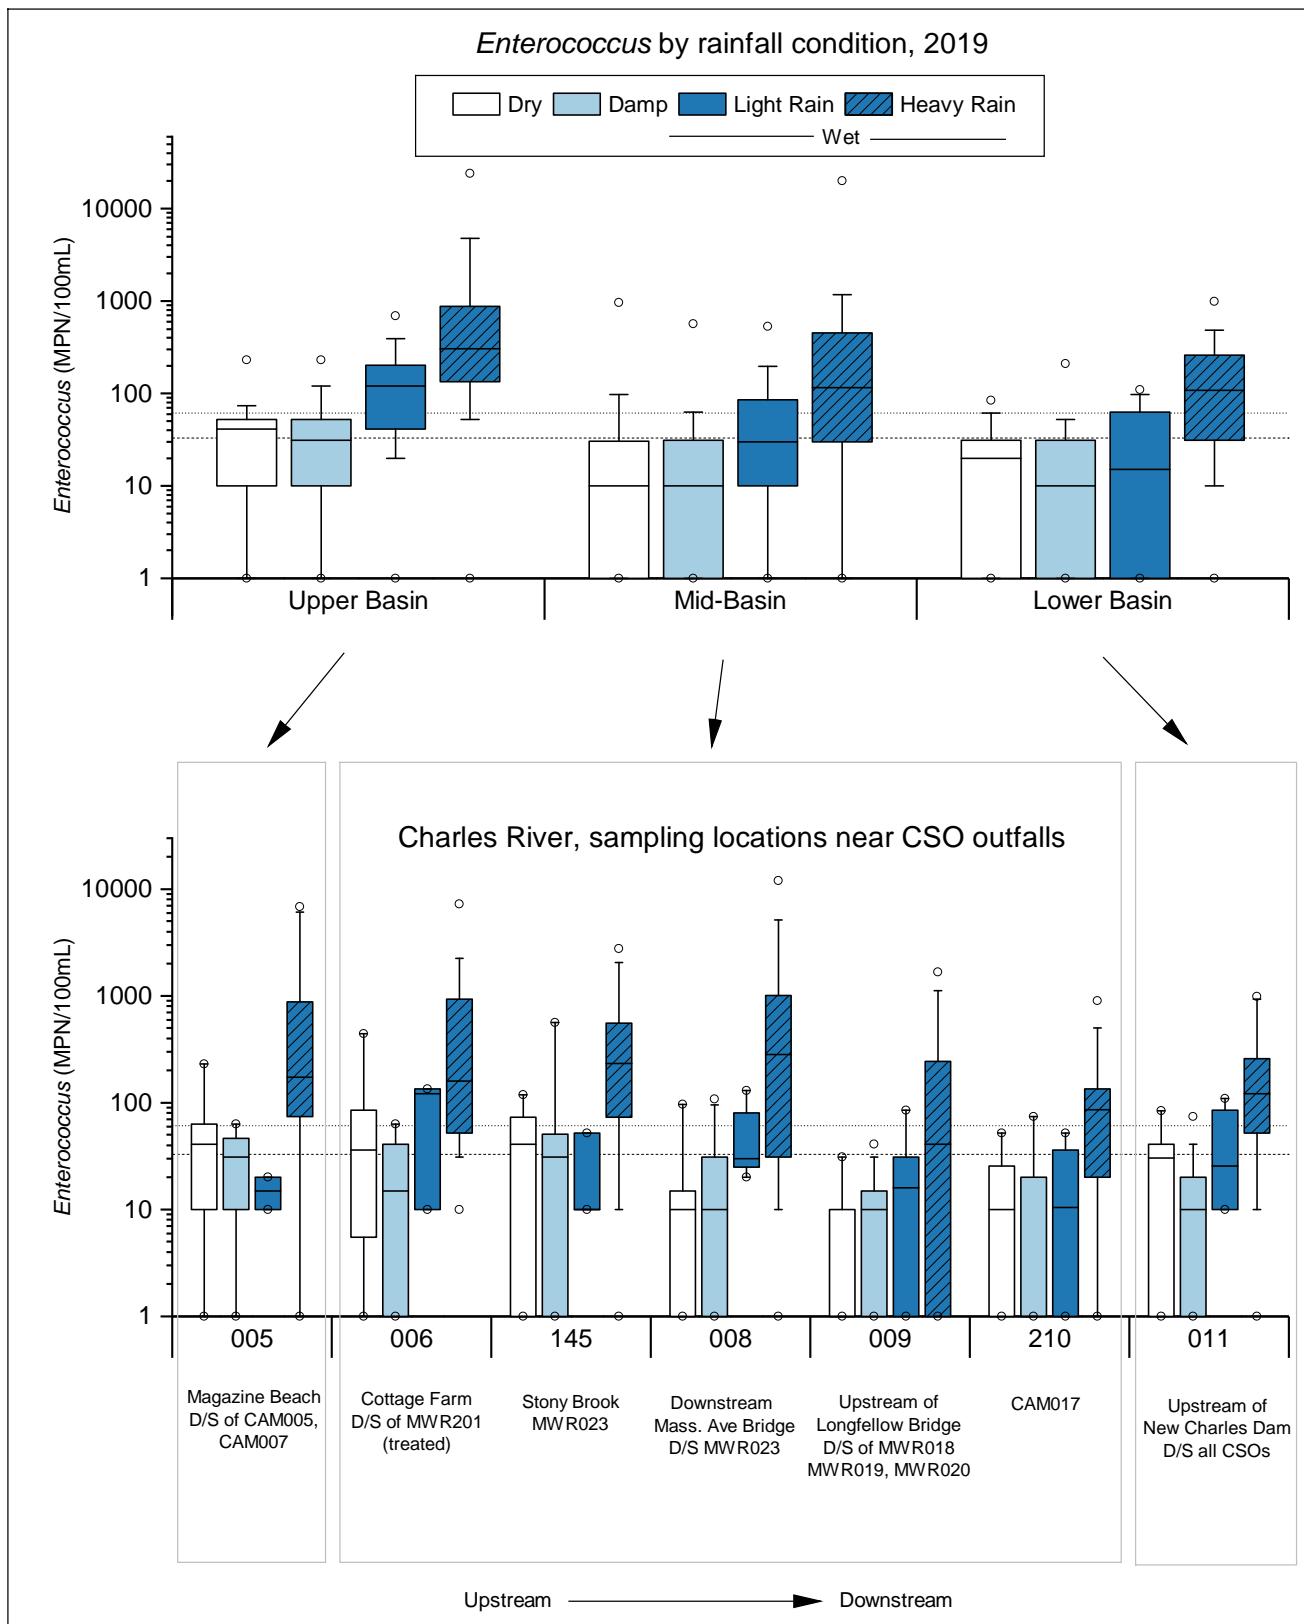

**Table 3-6. Geometric mean indicator bacteria, Charles River Basin, 2014 – 2018 and 2019.**

Stations designated for shoreline sampling (weekends or unsafe boating conditions) are shaded.

Station	Location	Surface or Bottom	Number of samples		<i>Enterococcus</i> (95% CI) <sup>1</sup> MPN/100 mL		<i>E. coli</i> (95% CI) <sup>1</sup> MPN/100 mL

<sup>1</sup> The MADEP limits are geometric means for both *Enterococcus* and *E. coli*.

<sup>2</sup> Includes samples taken at both 006 and 206.

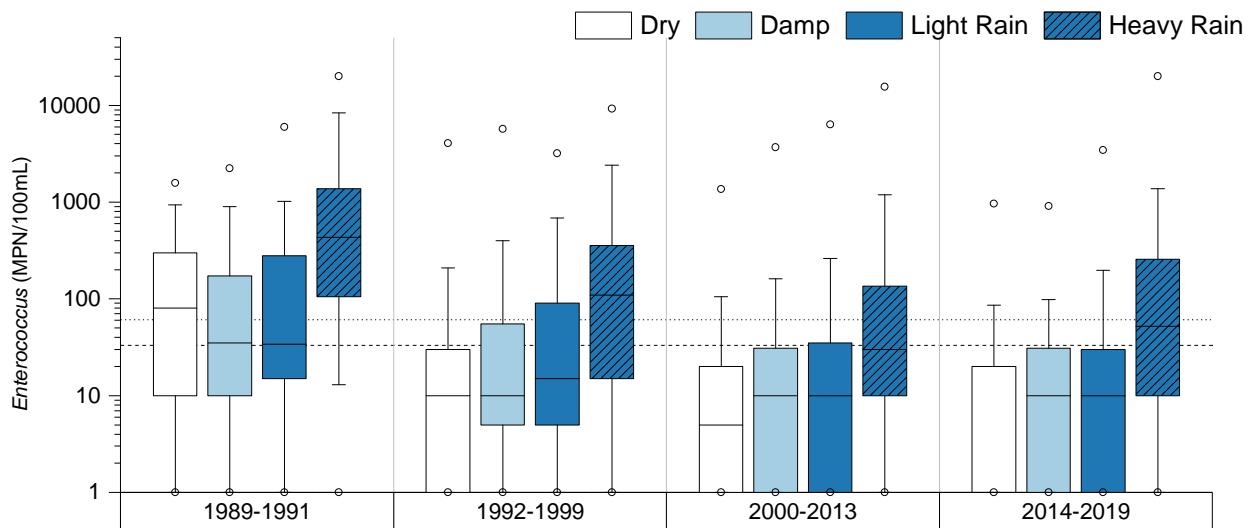

**Figure 3-6. *Enterococcus* by rainfall condition, Charles Basin, 2019.**

Dashed line shows MADEP freshwater standard of 33 MPN/100 mL for *Enterococcus*; dotted line shows the single sample standard of 61 MPN/100mL. Rainfall is rainfall from local MWRA, BWSC, and USGS rain gauges. “Dry”: no rainfall for previous 3 days; “Damp”: any rain < 0.15 inches at least two or three days previous to sampling and/or 0.1 inches in previous day; “Light Rain”: between 0.1 and 0.5 inches in previous day and/or between 0.15 and 0.5 in two previous days; “Heavy Rain”: more than 0.5 inches in previous 3 days. “D/S”: downstream. Station 006 includes samples from nearby station 206.

**Figure 3-7. Enterococcus over time, Upper Charles Basin (upstream of most CSOs) by phase of Long Term CSO Plan and rainfall condition.**

Dashed line shows State geometric mean standard (33 MPN/100mL), dotted line shows single sample standard (61 MPN/100mL). Data includes results for stations 012, 001, 144, 002, 004, and 005. Rainfall is NOAA rainfall from Logan airport. “Dry”: No rainfall for previous 3 days; “Damp”: any rain < 0.15 inches at least two or three days previous to sampling and/or 0.1 inches in previous day; “Light Rain”: between 0.1 and 0.5 inches in previous day and/or between 0.15 and 0.5 in two previous days; “Heavy Rain”: more than 0.5 inches in previous 3 days.

**Figure 3-8. Enterococcus over time, Lower and Middle Charles Basin by phase of Long Term CSO Plan and rainfall condition.**

Dashed line shows State geometric mean standard (33 MPN/100mL), dotted line shows single sample standard (61 MPN/100mL). Data includes results for all stations from 006 (BU bridge) downstream. Rainfall is NOAA rainfall from Logan airport. “Dry”: No rainfall for previous 3 days; “Damp”: any rain < 0.15 inches at least two or three days previous to sampling and/or 0.1 inches in previous day; “Light Rain”: between 0.1 and 0.5 inches in previous day and/or between 0.15 and 0.5 in two previous days; “Heavy Rain”: more than 0.5 inches in previous 3 days.

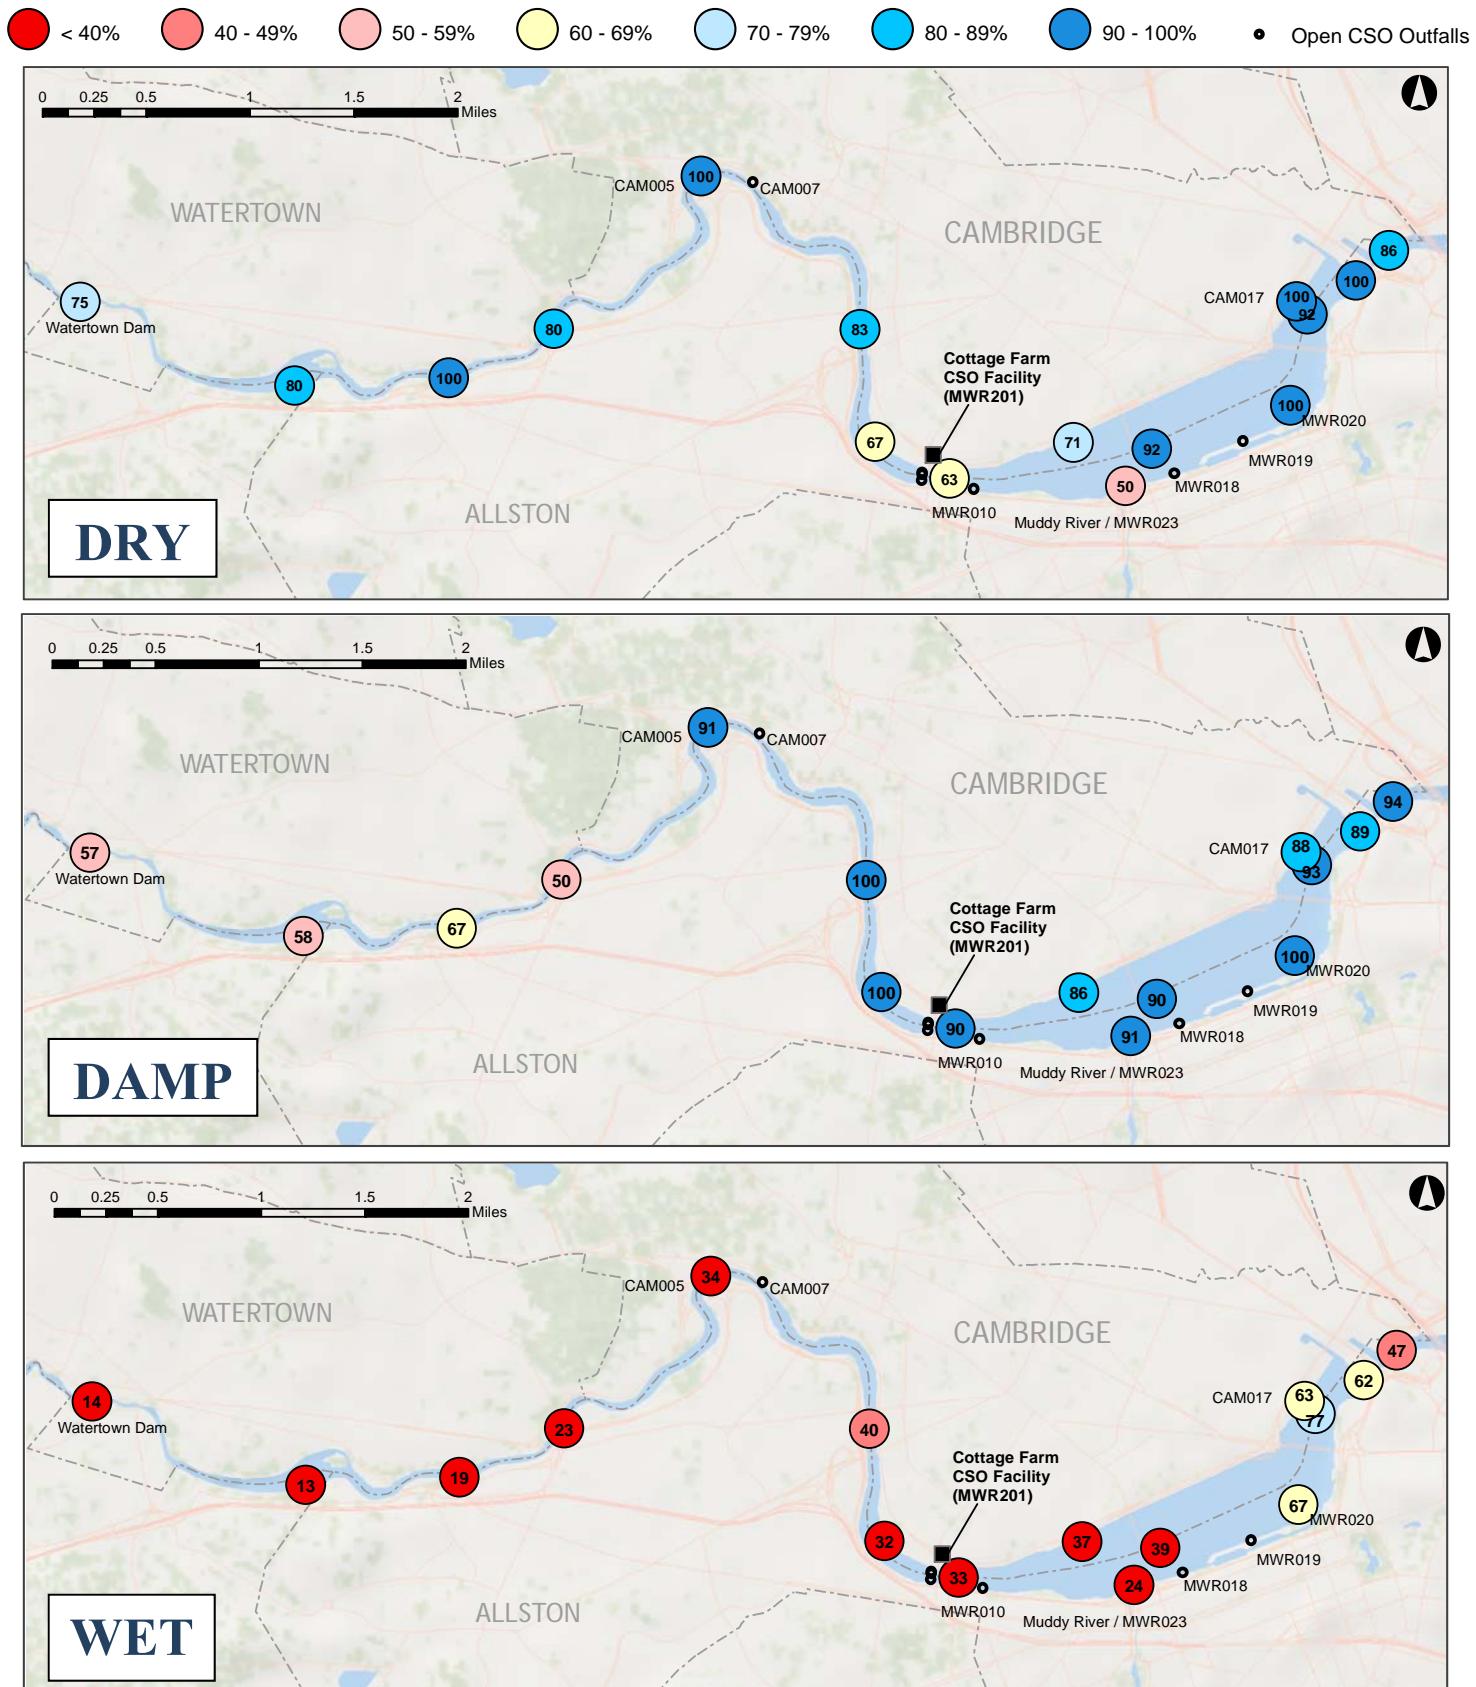

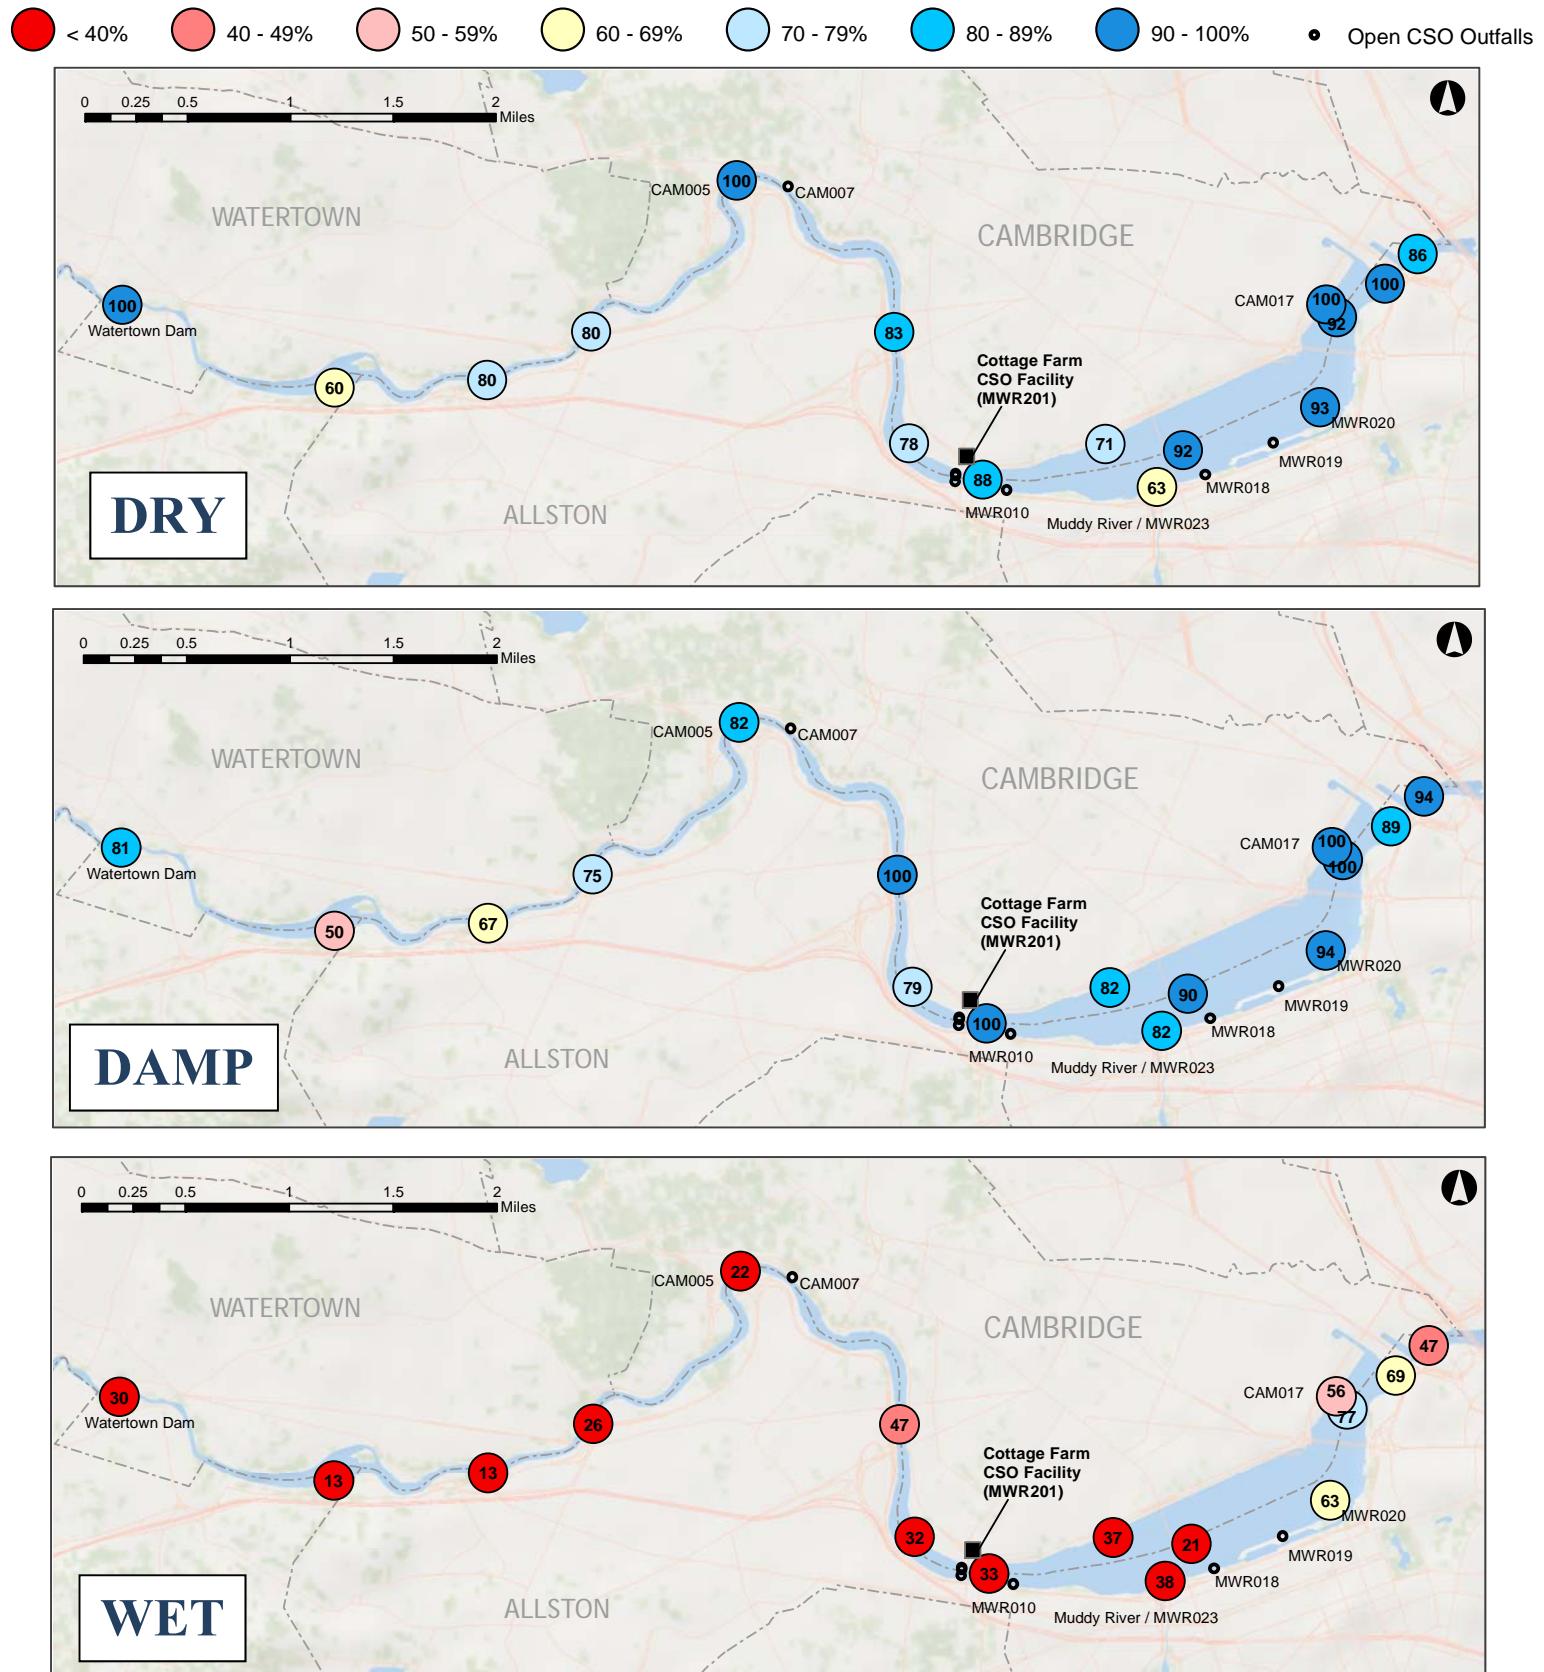

Figure 3-9. Charles River *Enterococcus* percent compliance by weather condition, 2019.

Compliance with 61 MPN/100mL single sample State standard. Rainfall is from nearest rain gauge to station. Dry: no rainfall for previous 3 days; Wet: > 0.5" previous 3 days or > 0.15" previous two days; Damp is everything in between. Dots are the monitoring locations pictured in Figure 3-1 and listed in Table 3-1.

**Figure 3-10. Charles River *E. coli* percent compliance by weather condition, 2019.**

Compliance with 235 MPN/100mL single sample State standard. Rainfall is from nearest rain gauge to station. Dry: no rainfall for previous 3 days; Wet: > 0.5" previous 3 days or > 0.15" previous two days; Damp is everything in between. Dots are the monitoring locations pictured in Figure 3-1 and listed in Table 3-1.

### *3.5 Summary of Charles River Water Quality*

The spatial distribution of 2019 bacterial water quality in the Charles across rain conditions was generally consistent with the previous several years. Annual geometric means downstream of the Massachusetts Avenue Bridge generally met state standards for *Enterococcus* despite bias toward sampling after the year's strongest storms. Charles River stations from 144 downstream routinely meet *Enterococcus* standards in dry and damp weather, but exhibit exceedances in wet weather, particularly at Upper Basin and upstream Mid-Basin stations. Generally, water quality was consistent with prior years, with more elevated concentrations at upstream locations (upstream of most CSOs) in all weather, and improving moving downstream to the New Charles River Dam. Chapter 5 provides more detailed analysis of bacteria concentrations following storms of various sizes.

As shown in Figure 3-7 and 3-8, *Enterococcus* counts have generally decreased in all regions of the Charles River, in all weather conditions, through the progression of MWRA's Long Term CSO Plan. In the 2014-2019 period, after completion of all construction projects in the region, the geometric mean of *Enterococcus* in all regions meets state standards in all but heavy rain.

Bottom-water dissolved oxygen met standards in the Upper Charles Basin, but failed to meet standards in the deeper waters of the Mid-Basin and the Lower Charles Basin, a pattern consistent with prior years. Any saltier harbor water that gets trapped in the Basin, after entering through the Charles locks, settles into deeper parts of the river basin, contributing to stratification of the basin and limiting exchange with surface waters. Surface water dissolved oxygen met standards at all locations in the Charles River.

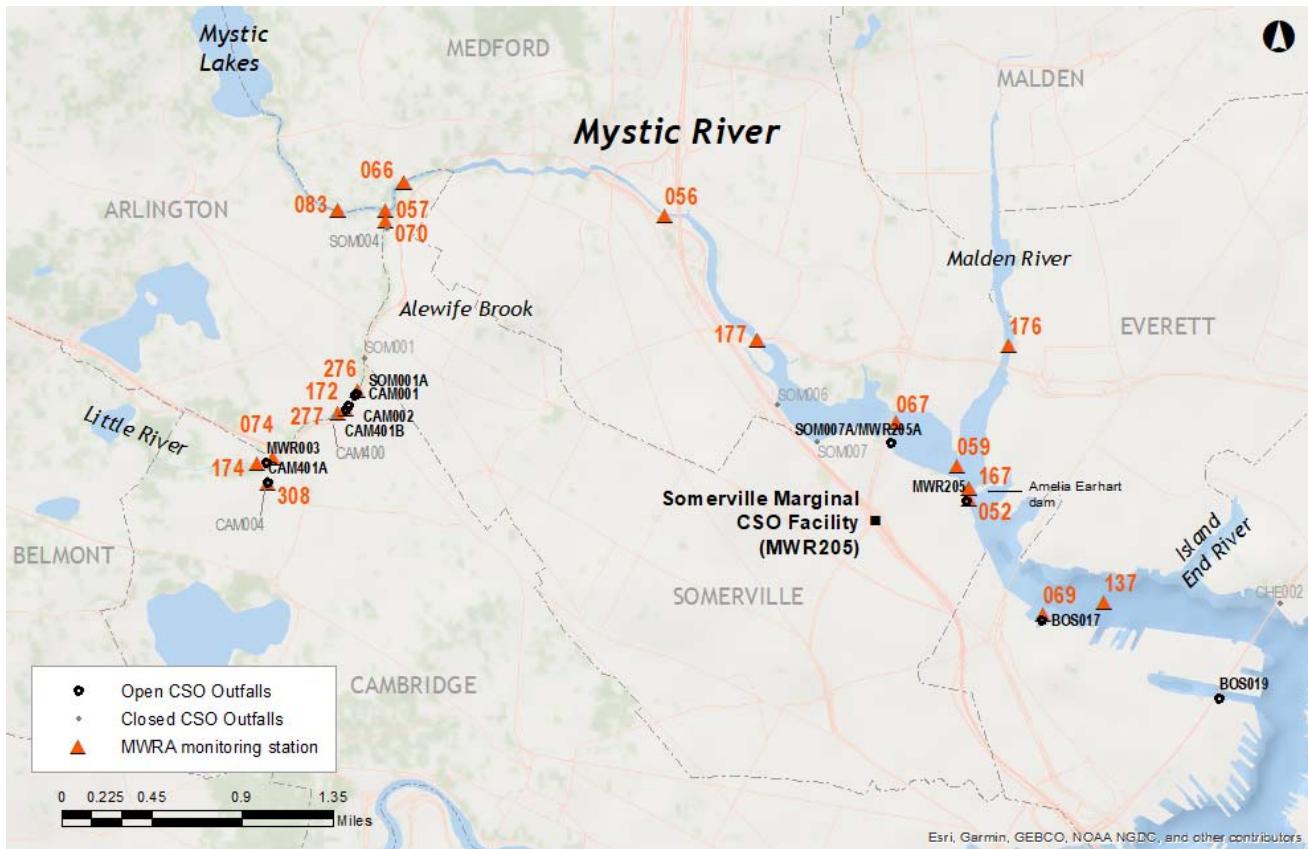

Nutrients and chlorophyll exhibited seasonal signals as expected, and closely followed long term averages overall. Elevated chlorophyll *a* was seen at upstream station 012 in the spring, and at station 166 in late summer and early fall, consistent with previous algae bloom patterns in the river.

## 4 Mystic River and Alewife Brook

### 4.1 Sampling area

Monitoring results of the Mystic River and tributaries are divided into four reaches. Sampling locations and CSO outfalls are shown on the map in Figure 4-1. Table 4-1 describes the reaches and the sampling locations within each reach.

In 2019, station 308 was added at the CAM401A outfall, the beginning of Alewife Brook. This station joins 277 and 276 among sampling locations added to support the CSO performance assessment described in Chapter 1.

**Figure 4-1. Map of Mystic River sampling locations.**

### 4.2 Pollution sources

Known pollution sources to the Mystic River/Alewife Brook are shown in Table 4-2 and consist of stormwater, upstream inputs and CSOs. Nine CSO outfalls are located in Cambridge and Somerville, including six active CSO outfalls in Alewife Brook, and one treated CSO outfall in the Lower Mystic basin (Somerville Marginal CSO, MWR205A/SOM007A), which discharges screened, chlorinated, and dechlorinated flow only during an activation occurring at high tide. At low tide, the Somerville Marginal CSO outfall (MWR205) discharges downstream of the Amelia Earhart dam, screening, chlorinating, and dechlorinating CSO flow

before discharge. It is the only source of treated CSO discharge to the Mystic River below the Amelia Earhart dam, although there is an untreated outfall (BOS017) as well. This area downstream of the dam is not in the variance area for the Alewife Brook/Upper Mystic River. In 2019, Somerville Marginal MWR205A/SOM007A had 12 discharge events, and Somerville Marginal MWR205 had 27 activations resulting in discharge below the dam. BOS017 discharged 12 times in 2019. CAM401A and SOM001A are the most frequent CSO discharges to Alewife Brook, discharging 10 times and 7 times, respectively, in 2019.

Table 4-3 shows the MWRA model simulation and facility metering results for CSOs affecting the Mystic River and Alewife Brook in calendar year 2019. Metered CSO volumes and activation frequency are available for the Somerville Marginal CSO facility, while the remaining results were obtained using results from MWRA's recently calibrated hydraulic model, as explained in Section 3.2.

Table 4-4 summarizes the proportion of samples collected in dry, damp, and wet weather. Due to the focus on storm recovery sampling and the frequency of storms during the sampling season, nearly half of samples collected in the Mystic River and Alewife Brook were under wet weather conditions.

**Table 4-1. MWRA monitoring locations, Mystic River and Alewife Brook.**

Reach	Description of Reach	Sampling station	Location Description
Alewife Brook (Class B/Variance, warm water fishery)	Tributary to Mystic River. NS: no applicable numerical standard or guideline. ND: no data. n: number of samples.

<sup>1</sup> Summer (June–October), Winter (January–March).

<sup>2</sup> Median and standard error of the median are shown for pH, rather than arithmetic mean and standard deviation.

<sup>3</sup> MADPH standard of ≥1.2 meters applies only to public bathing beaches; there are none in the Upper Mystic/Alewife Brook.

<sup>4</sup> For bacterial data, 95% confidence intervals (CI) are provided rather than standard deviations

<sup>5</sup> First number is the all samples geometric mean limit - compare to the "Mean±SD" column (i.e., the Mean in that column is the geometric mean of all stations in that region for the specified indicator bacteria); the second number is the single sample standard - compare to the "% meeting guideline" column (i.e., the "% meeting guideline" column is the percentage of samples meeting the single sample standard). The "Range" column gives the range of single sample results.

<sup>6</sup> Either *E. coli* or *Enterococcus* are acceptable indicators for EPA, MADEP, and MADPH to assess suitability for swimming in freshwater.

## 4.4 Water quality results, 2019

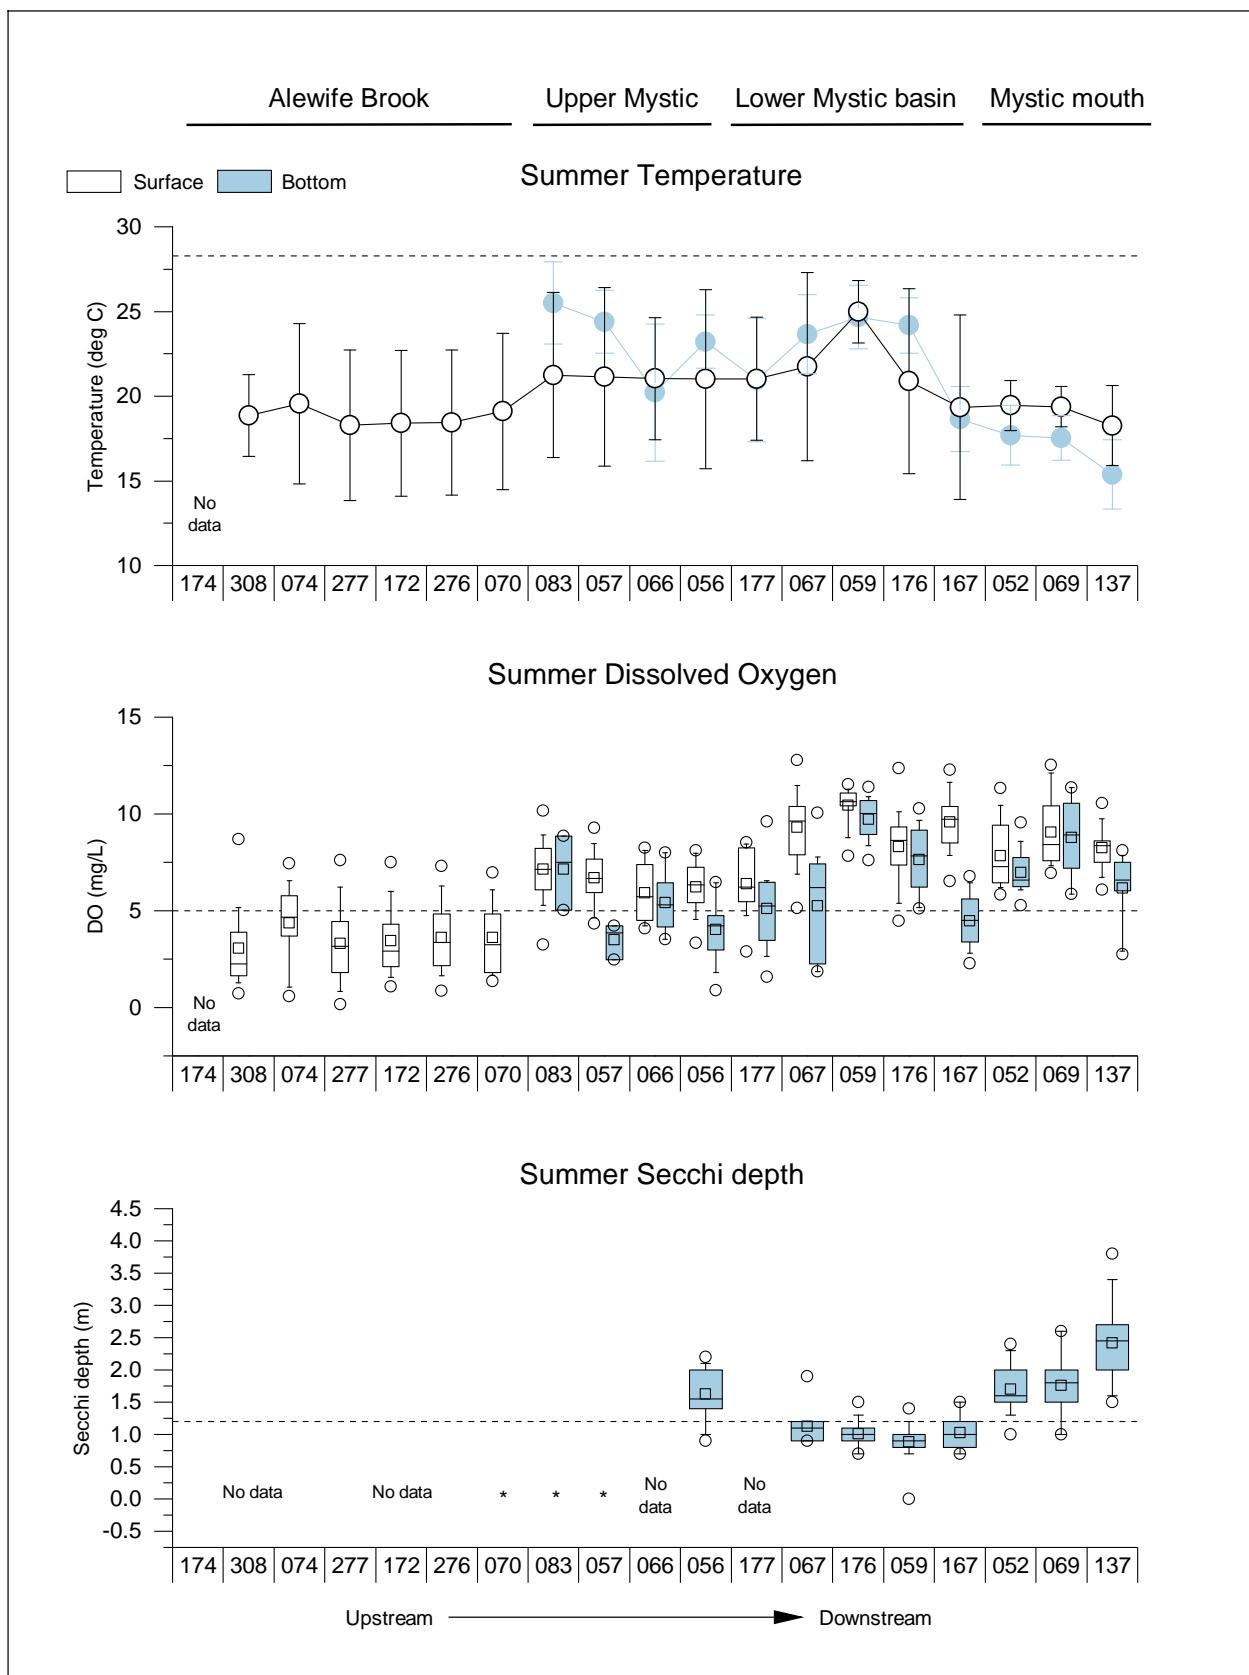

This section reports spatial trends for water quality parameters measured in the Mystic River/Alewife Brook in 2019.

### 4.4.1 Physical measurements

**Temperature.** Summer (June to October) mean temperatures for 2019 are shown for each sampling location in the uppermost graph of Figure 4-2. Bottom temperatures appear higher in the Mystic main stem at shoreline locations, as more measurements were taken at the surface during shoreline surveys in October. This is highlighted by the similar average surface and bottom temperatures at 066, 177, and 059, which are not included on the storm recovery shoreline surveys. Bottom temperatures at deeper locations in the Mystic mouth have lower annual averages. The lower bottom temperature at Amelia Earhart Dam (station 167) demonstrates the stratification due to salt water intrusion. The Mystic River has a much shallower depth than the Charles River, and exhibits generally warmer bottom temperatures. All stations in this region met water quality standards for temperature in 2019.

**Dissolved Oxygen.** Dissolved oxygen is shown in the center graph of Figure 4-2. Mean surface dissolved oxygen concentrations met the State standard of  $\geq 5.0$  mg/L at all locations in the Mystic and Malden Rivers. Surface dissolved oxygen in Alewife Brook is typically lower than the Mystic River, and is often below the State standard. Surface DO concentrations in Alewife Brook were lower in 2019 than 2018, and consistent along the length of the brook. Average summer bottom water concentrations were below the State standard at station 057 at the Alewife Brook confluence, station 056 near Medford Square, and the deeper station 167 at Amelia Earhart Dam.

**Water clarity.** Water clarity is indicated by Secchi disk depth, which appears for each sampling location in the bottom graph of Figure 4-2. Water clarity for all but the Mystic River mouth is low, with all stations upstream of the Dam (excluding station 056) failing to meet the MADPH beach guideline of 1.2 meters. Alewife Brook and several of the Upper Mystic locations are often clear to the bottom and too shallow to measure Secchi depth. River depth at those locations are typically 0.5 meters in Alewife Brook, and 1 meter in the Mystic River.

**Figure 4-2. Summer temperature, dissolved oxygen, and Secchi depth, Mystic River, 2019.**

Dashed lines are State standards or guideline (maximum for temperature, minima for DO and Secchi). Station 174 was too shallow for accurate summer temperature and DO readings in 2019. Stations 174, 308, 074, 277, 172, 276, 066, and 177 were typically too shallow for Secchi measurements in the summer months of 2019. Stations 070, 083, and 057 were clear to the bottom for all visits in 2019, indicated by \*. Hollow squares on the DO and Secchi plots indicate the arithmetic mean.

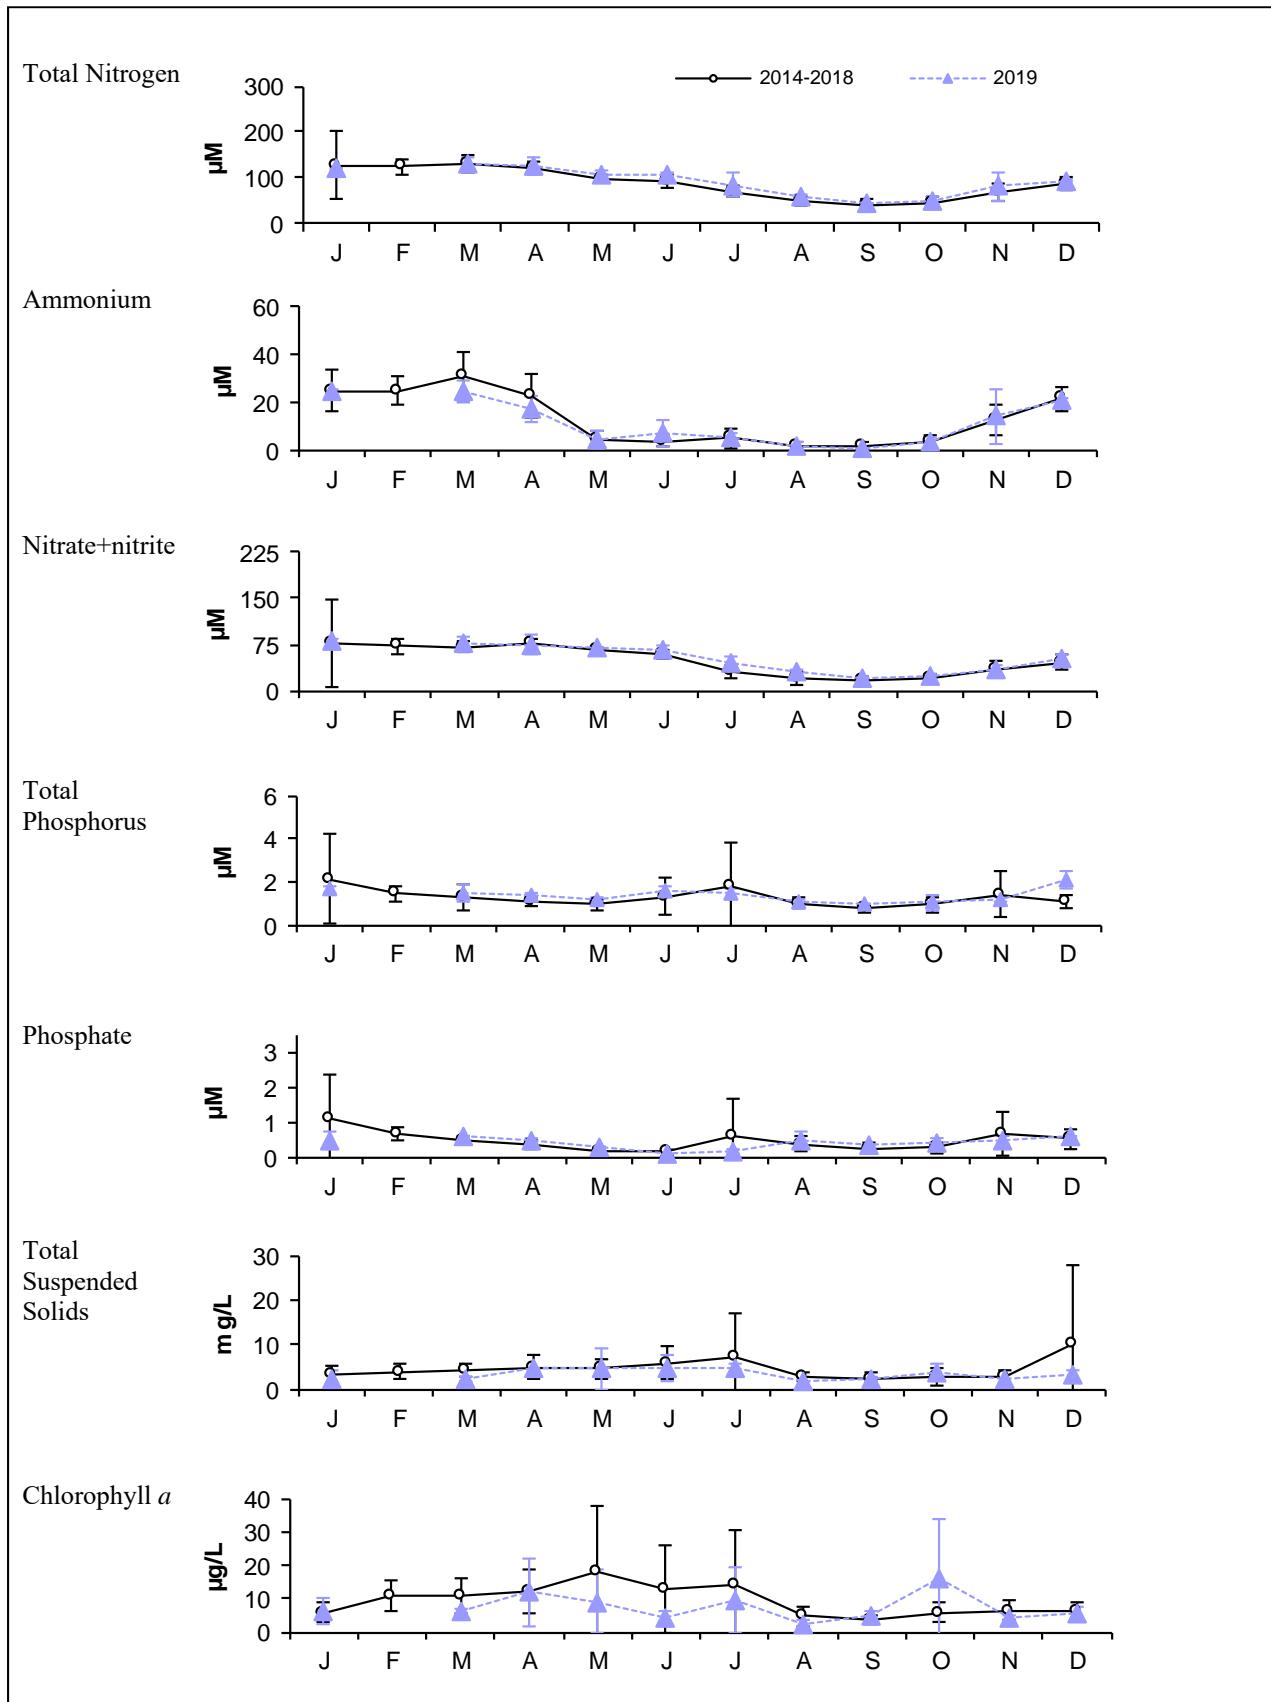

#### 4.4.2 Nutrients, TSS and chlorophyll

Figures 4-3 through 4-6 show monthly average total nitrogen, ammonium, nitrate/nitrite, total phosphorus, phosphate, total suspended solids, and chlorophyll *a* at the upstream Mystic locations (083 upstream of Alewife Brook and 066 at Boston Ave.), downstream (167 at Amelia Earhart Dam) and river mouth (137). Results are not available from station 083 in February 2019 due to river freezing.

Regionally, ammonium, nitrate/nitrite, and phosphate results show relatively strong seasonal effects, as biological activity increases during the summer months. In winter months, when biological nutrient uptake is low, ammonium concentrations in the Upper Mystic are double the concentration in the Charles Basin.

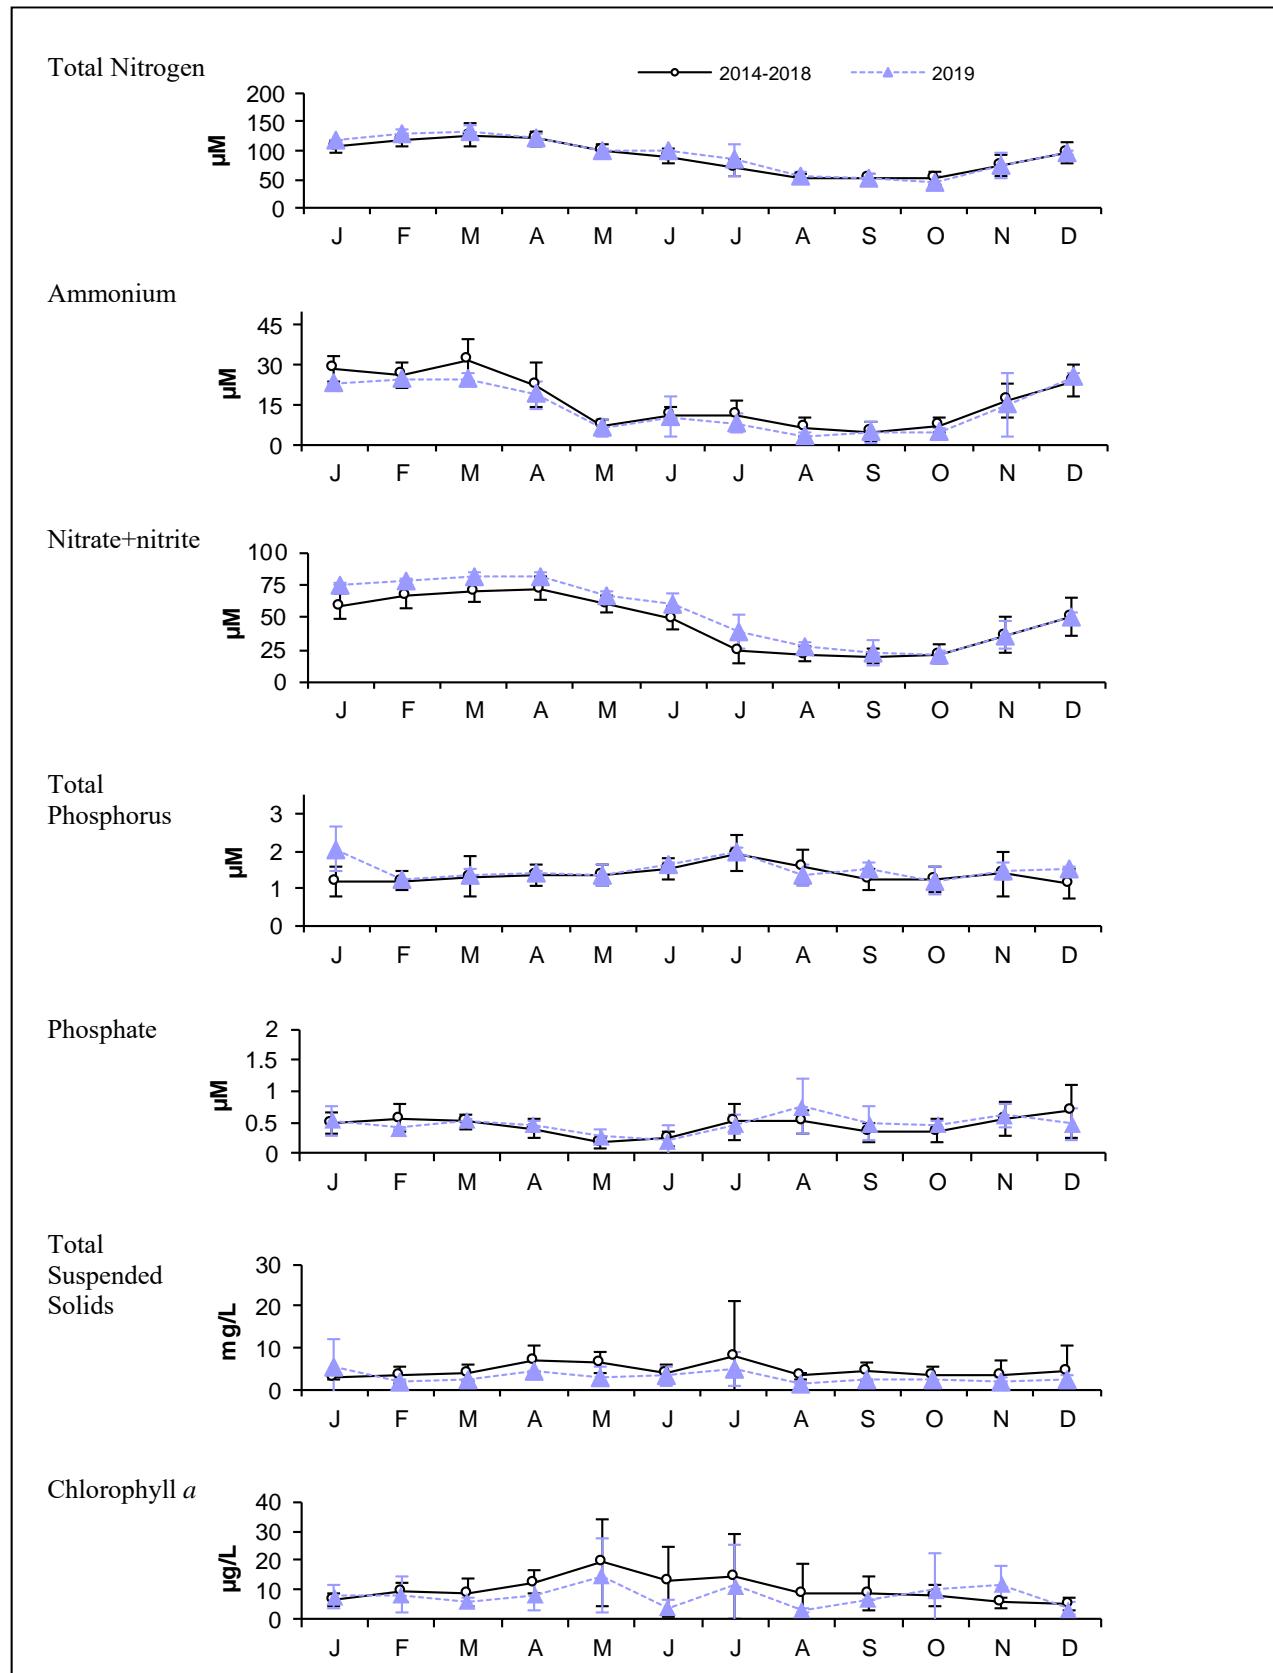

At freshwater Mystic River locations 083, 066, and 167, nutrient results in 2019 were very similar to the previous five-year average (2014-2018). Seasonal signals are more evident in nitrogenous compounds than in total phosphorus or phosphate. Total suspended solids and chlorophyll *a* values were lower than the five-year average throughout the year, aside from an increase in chlorophyll *a* at all stations in the fall. There is no clear signal in the nutrient data preceding this elevated chlorophyll *a*.

At marine station 137 in the Mystic mouth, nutrient results generally aligned with the seasonal pattern of the previous five years while exhibiting slightly lower magnitude. Notably, chlorophyll *a* in July and August was significantly lower than the typical average, before a harbor-wide *Karenia mikimotoi* dinoflagellate bloom in late summer. Nutrient concentrations were lower than the five-year average in October following this bloom.

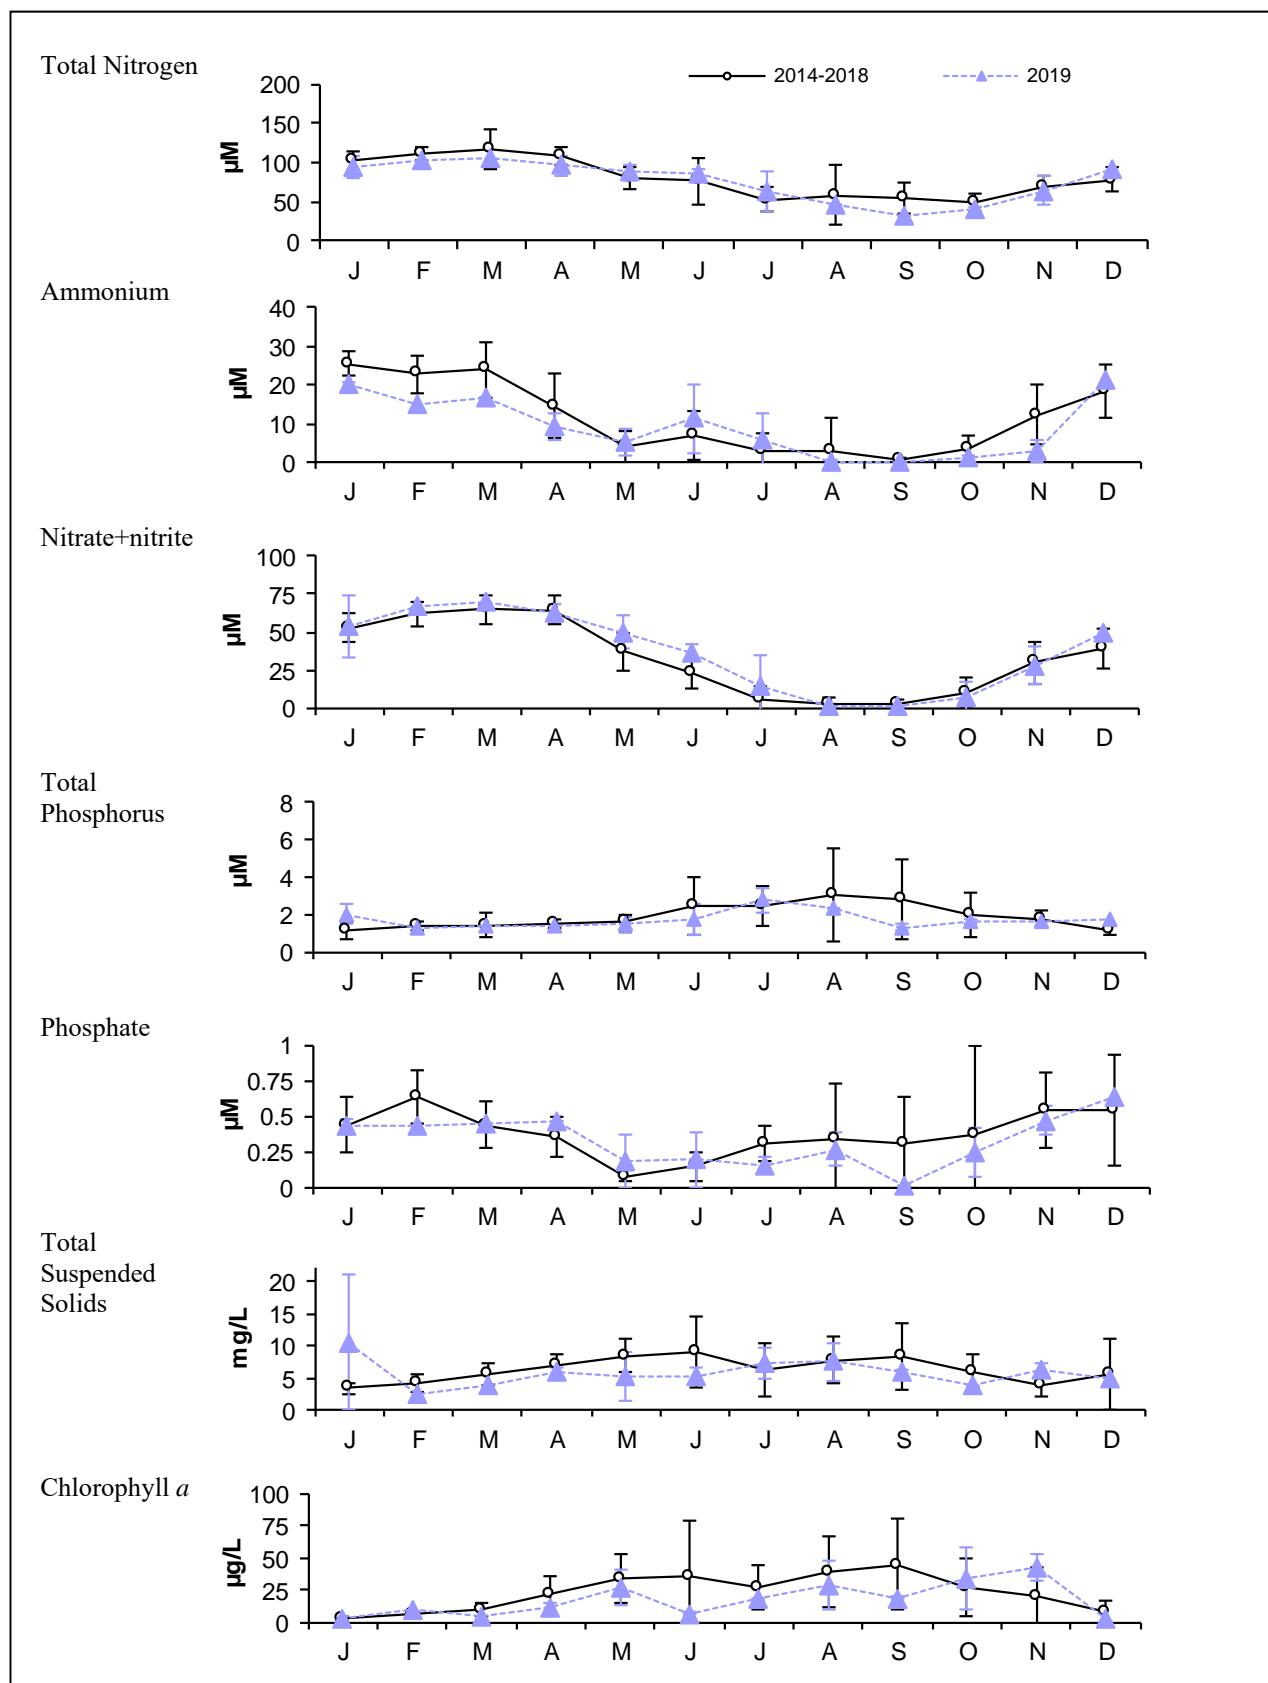

**Figure 4-3. Monthly average nutrients, TSS and Chlorophyll, 2014 – 2018 and 2019, Station 083, Mystic upstream of Alewife Brook.**

Error bars are  $\pm 1 \text{ SD}$ . Note different scales than for Figures 4-4, 4-5 and 4-6 for most parameters.

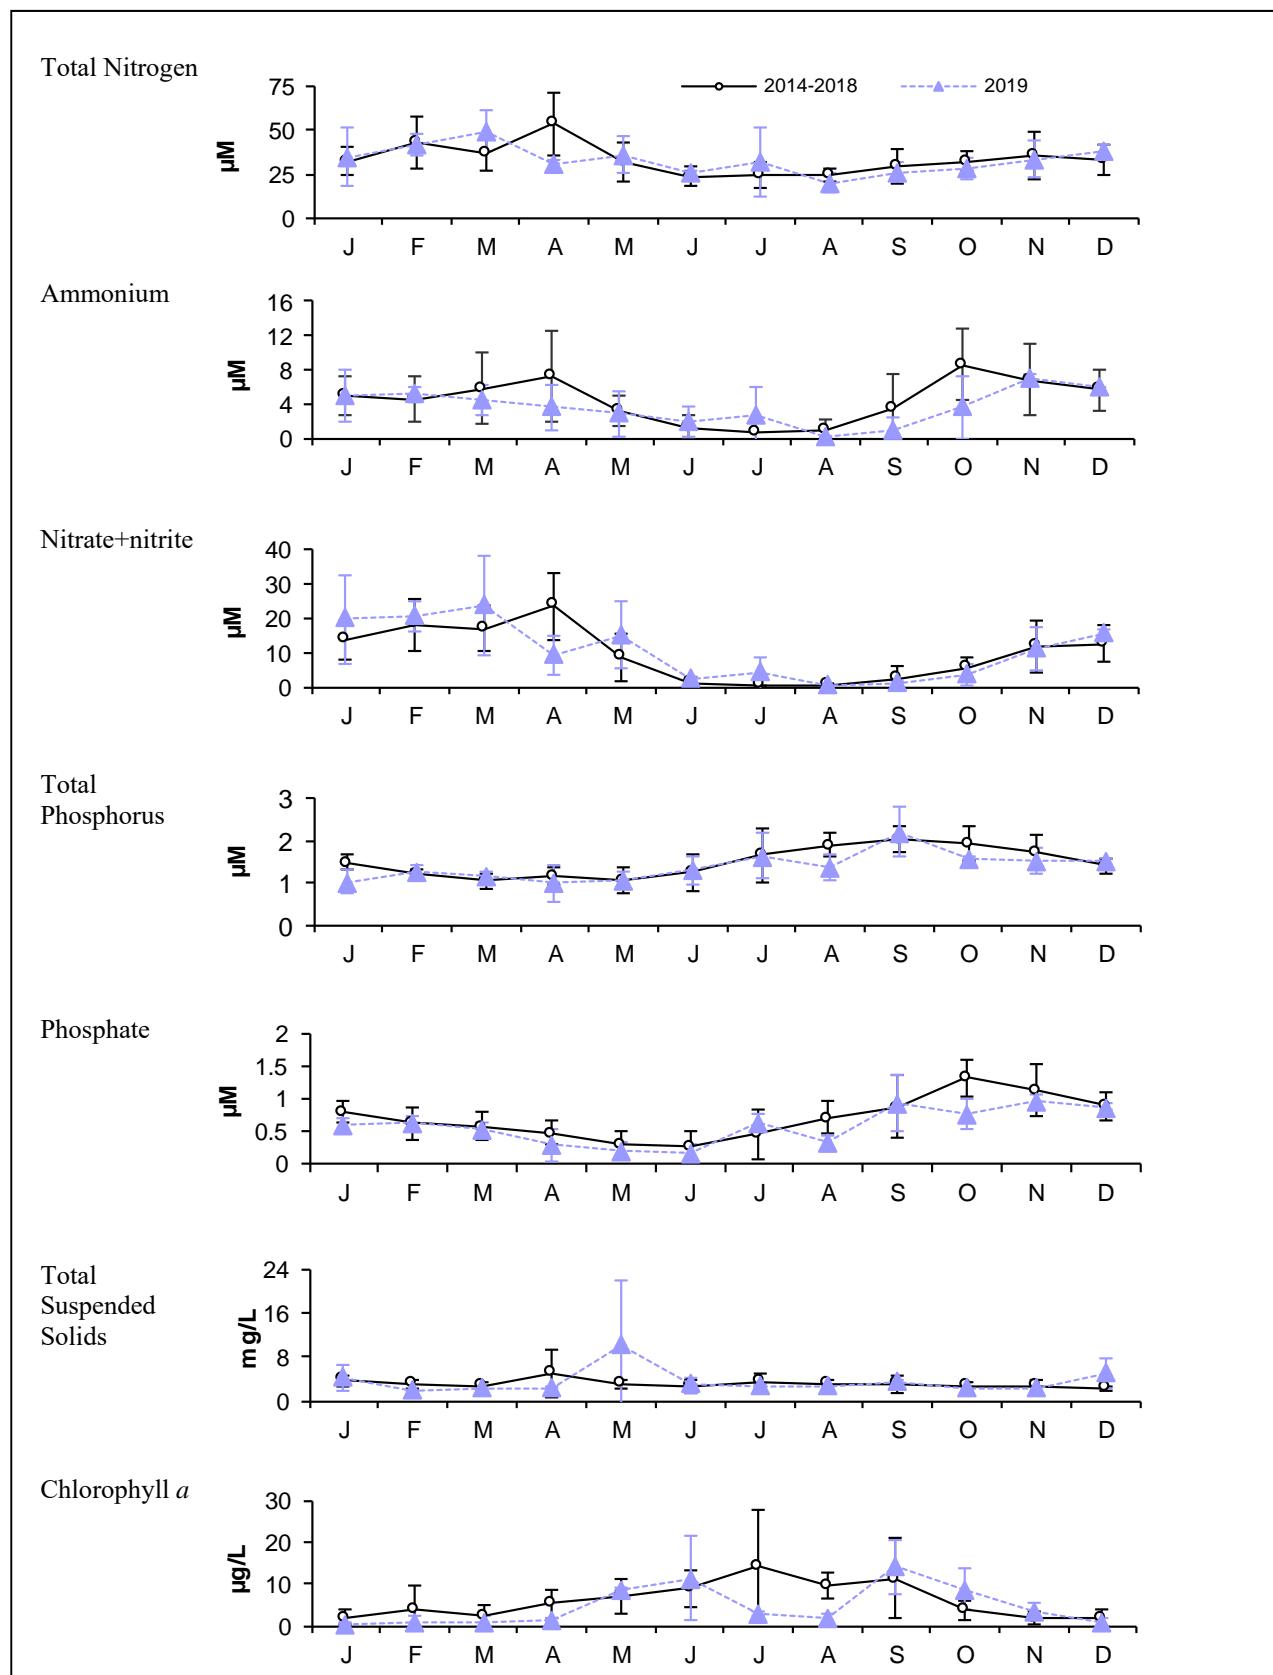

**Figure 4-4. Monthly average nutrients, TSS and Chlorophyll 2014 – 2018 and 2019, Station 066, Boston Ave.**

Error bars are  $\pm 1$  SD. Note different scales than Figures 4-3, 4-5 and 4-6 for most parameters.

**Figure 4-5. Monthly average nutrients, TSS and Chlorophyll 2014 – 2018 and 2019, Station 167, Amelia Earhart Dam (upstream/freshwater).**

Error bars are  $\pm 1 \text{ SD}$ . Note different scales than Figures 4-3, 4-4 and 4-6 for most parameters.

**Figure 4-6. Monthly average nutrients, TSS and Chlorophyll 2014 – 2018 and 2019, Station 137, Mystic River mouth (marine).**

Error bars are  $\pm 1$  SD. Note different scales than Figures 4-3, 4-4 and 4-5 for most parameters.

#### 4.4.3 Bacterial water quality

Figure 4-7 shows the bacterial water quality at each location sampled in the Mystic River and Alewife Brook for 2019 for dry, damp, and wet weather. The rainfall conditions are derived, on a station-by-station basis, from the nearest rain gauge. For this area, the three gauges in use are the BWSC Charlestown gauge, the USGS Fresh Pond gauge, and the newly installed MWRA gauge at the Somerville-Marginal CSO Treatment Facility. The uppermost graph in the figure shows percentile plots of *Enterococcus* counts for each location, arranged from upstream to downstream for 2019. The center graph shows percentile plots of *E. coli*, which is only monitored in the freshwater portion of the Mystic River, and the bottom graph fecal coliform, which is only monitored in the marine portion of the Mystic River in place of *E. coli*. As emphasized in Table 4-4, Mystic River and Alewife Brook sampling occurred frequently following significant rain events in 2019, with 45% of the samples taken in wet weather conditions.

As shown in Figure 4-7, all locations in Alewife Brook consistently failed to meet both *Enterococcus* and *E. coli* geometric mean standards in dry, damp, and wet weather in 2019. Bacteria concentrations at stations 083 (Mystic Lakes outlet, before the confluence with the Alewife Brook) and 057 (Alewife Brook/Mystic River confluence) exhibited a similar distribution in wet weather, demonstrating low impact of Alewife Brook on the Mystic River. Samples taken in the Lower Mystic Basin met standards in dry and damp weather, and occasionally in wet weather. Malden River station 176 met standards in dry and damp weather, but exhibited very high counts in wet weather. *Enterococcus* and fecal coliform results from the three marine stations demonstrated elevated dry weather results at station 052, but general compliance with standards otherwise.

Geometric means for each indicator for 2014 - 2018 and 2019 appear in Table 4-6 (Alewife Brook) and 4-7 (Mystic River), for all weather conditions combined. Overall, annual geometric means did not meet water quality standards at most locations, and most 2019 geometric means were higher than the previous five years. This is largely due to the frequency of rainfall events in the region in 2019 and a targeted approach of sampling consecutive days following these events. While these results increase our understanding of wet weather impacts, these annual geometric means do not represent typical conditions at these stations. Stations 067, 059, and 167 in the Lower Mystic Basin met standards for both indicators despite this wet weather bias. Station 056 (Medford Square between Craddock Bridge and I-93) exhibited high bacteria counts without influence of nearby CSOs. This is also reflected in the noticeably high wet weather counts at this location, as seen in Figure 4-7. Malden River station 176 matched the state standard for *Enterococcus* but exceeded for *E. coli*. Annual geometric means did not meet standards at the seven Alewife Brook stations. Results at Alewife Brook stations 172 (Mass. Ave. bridge) and 276 (new station downstream of SOM001A) were very similarly distributed. The highest bacteria counts in Alewife Brook were seen at station 308, immediately downstream of the CAM401A CSO outfall. Bacteria counts at station 308 were elevated in all weather conditions. Like the Charles River, *E. coli* counts are consistently higher than *Enterococcus* counts at all stations.

Annual geometric means for surface samples collected at station 052, a near-shore Mystic mouth station downstream of Amelia Earhart Dam exceeded geometric mean standards for both *Enterococcus* and

fecal coliform, though most elevated results were found in dry weather. Geometric means met both standards at Mystic mouth stations 069 at CSO outfall BOS017 and 137 upstream of the Tobin Bridge.

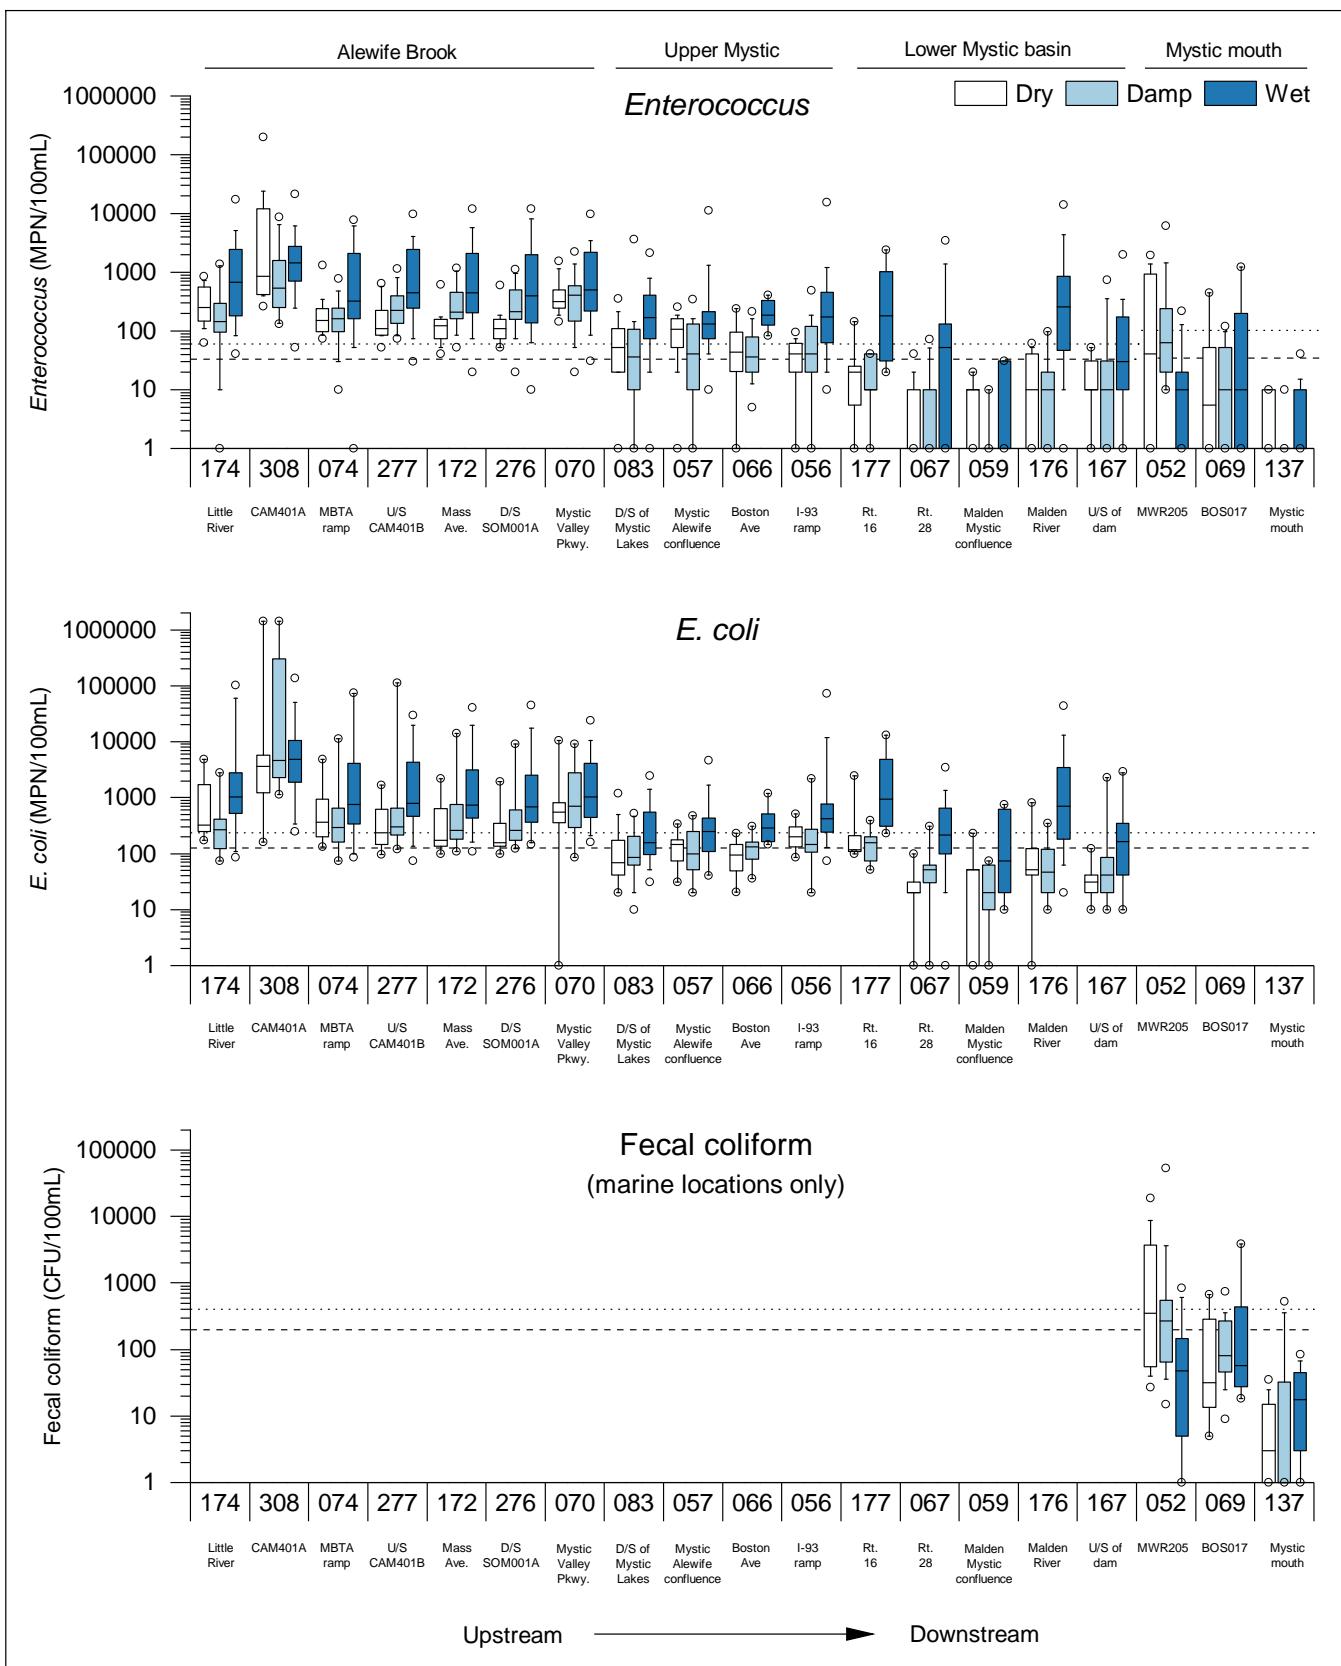

The spatial and temporal change in *Enterococcus* concentrations in Alewife Brook and the Mystic River appear in Figure 4-8 through Figure 4-10. Figure 4-8 shows the impact of rainfall on *Enterococcus* densities on the four river reaches in 2019, along with locations near CSO outfalls. 2019 *Enterococcus* results were distributed similarly to recent years, particularly 2018, which exhibited a similar sampling structure and frequency of rain events. In the Alewife, the Little River station 174 upstream of CSOs – as well as all other stations – fails to meet standards in dry, damp, and wet weather, suggesting persistent contamination not necessarily tied to CSOs. In the Upper Mystic, results were typically below the single sample standard in dry and damp conditions, but often exceeded in wet weather, with little difference in distribution between light and heavy rain. Lower Mystic counts were very low in dry, damp, and light rain conditions and often met following heavy rains. Station 052 at the Amelia Earhart Dam and the treated Somerville Marginal CSO facility outfall, had a wide distribution of results in dry weather, but often met standards in wet weather conditions. This pattern is dissimilar to the low dry weather counts and elevated wet weather counts typically seen at this location. It is important to note that stormwater enters the Somerville Marginal CSO facility outfall conduit before the discharge enters the Mystic River. Therefore, results at station 052 reflect ambient conditions in the river and the potential effects of treated CSO and untreated stormwater.

Results in Figures 4-9 (Alewife Brook) and 4-10 (remainder of the Mystic) are grouped by phases of the Long Term CSO Plan improvements and include the geometric mean counts in each rainfall condition. Figure 4-9 shows minimal changes in dry or damp *Enterococcus* counts in the Alewife, but decreases in the magnitude of exceedance in wet weather, particularly in the 2016-2019 period following completion of all LTCP-related construction in this region. *Enterococcus* results in Figure 4-10 show slight improvement over time in the Mystic River in dry and wet weather since the early 1990s, particularly in dry and light rain conditions. In the four years of data collected following LTCP project completion, results are similarly distributed to the previous LTCP phase.

Mystic River 2019 compliance rates with single sample State standards for both indicators are shown in Figures 4-11 (*Enterococcus*) and 4-12 (*E. coli*). Dots on the figure are the monitoring locations shown in Figure 4-1 and listed in Table 4-1. Compliance rates vary highly year-to-year and between indicators. Compliance rates in the Mystic River were generally higher for *E. coli* than *Enterococcus*. Station 056 near Medford Square exhibited very low compliance in wet weather without influence of nearby CSO. Mystic stations 057 and 066 near the confluence with Alewife Brook demonstrate the limited impact of Alewife Brook on the Mystic in dry weather. Stations 059 and 167 near Amelia Earhart Dam and downstream of the Somerville Marginal CSO relief outfall were over demonstrated very high compliance rates in 2019.

Alewife Brook 2019 compliance rates with single sample State standards for both indicators are shown in Figures 4-12 (*Enterococcus*) and 4-13 (*E. coli*). The dots shown on the maps correspond to the monitoring locations shown in Figure 4-1 and listed on Table 4-1. Compliance rates were generally low in all weather conditions, and were similar at all stations in Alewife Brook, regardless of proximity to

CSO outfall. All Alewife stations were below 15% compliant in wet weather, for both indicators. Like the Charles, some discrepancies in compliance between the two indicators exist, with stations near Massachusetts Avenue under 20% compliant in damp weather for *Enterococcus*, but over 50% compliant for *E. coli*.

**Figure 4-7. Indicator bacteria concentrations, Mystic River/Alewife Brook, 2019.**

Dashed lines show MADEP *Enterococcus* and *E. coli* and the former fecal coliform geometric mean standards. Dotted lines show the single sample standards. Note that freshwater and marine *Enterococcus* standards differ. *E. coli* testing was discontinued in 2007 in marine waters for methodological reasons. Dry: no rainfall for previous 3 days; Wet: at least 0.5 inches in previous 2 days; damp is everything in between. Rainfall conditions are derived from either the BWSC Charlestown or USGS Fresh Pond rain gauges. "D/S": downstream; "U/S": upstream.

**Table 4-6. Geometric mean indicator bacteria, Alewife Brook, 2014 – 2018 and 2019.**

All Alewife Brook stations are designated for shoreline sampling (including weekends), shaded.

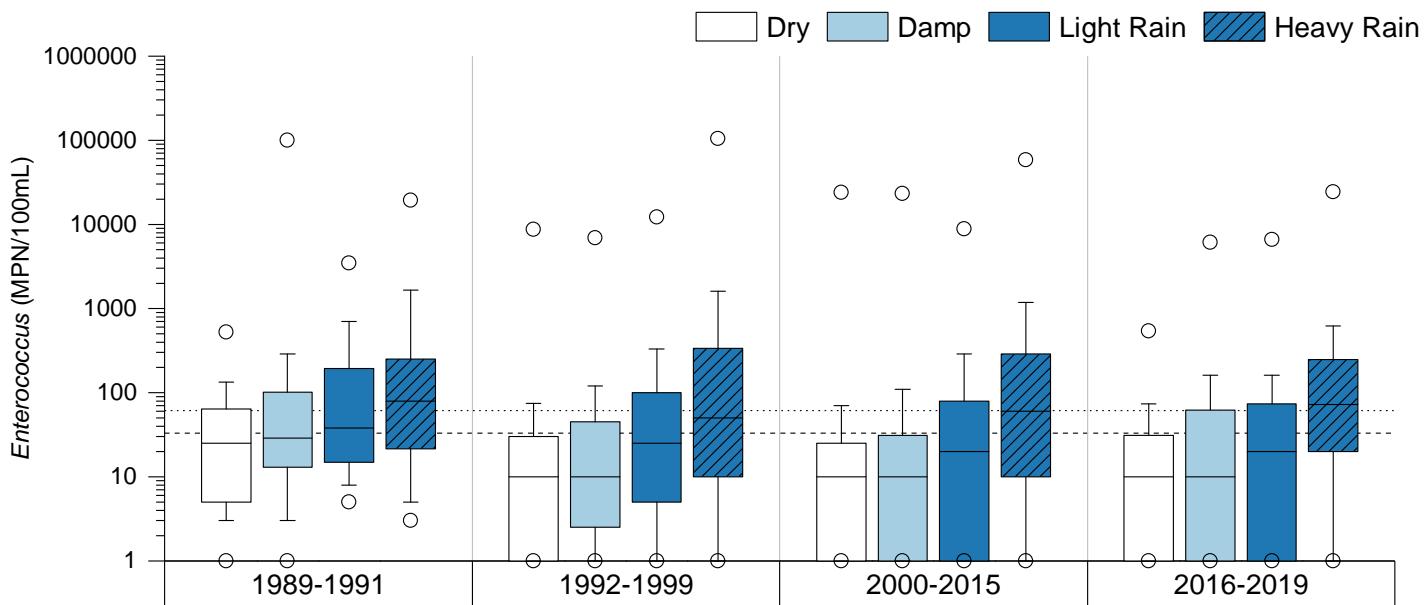

**Figure 4-8. Enterococcus by rainfall condition, Mystic River/Alewife Brook, 2019.**

Dashed lines show MADEC state geometric mean standards (33 MPN/100mL and 35 MPN/100mL for freshwater and marine). Dotted lines show single sample State standards (61 MPN/100mL and 104 MPN/100mL for freshwater and marine). Rainfall is from the BWSC Charlestown or USGS Fresh Pond gauge. “Dry”: no rainfall for previous 3 days; “Heavy”: more than 0.5 inches in previous 3 days; “Damp” and/or rain distant in time: any rain < 0.15 inches at least two or three days previous to sampling and/or 0.1 inches in previous day; “Light rain”: between 0.1 and 0.5 inches in previous day and/or between 0.15 and 0.5 in two previous days. “D/S”: downstream; “U/S”: upstream.

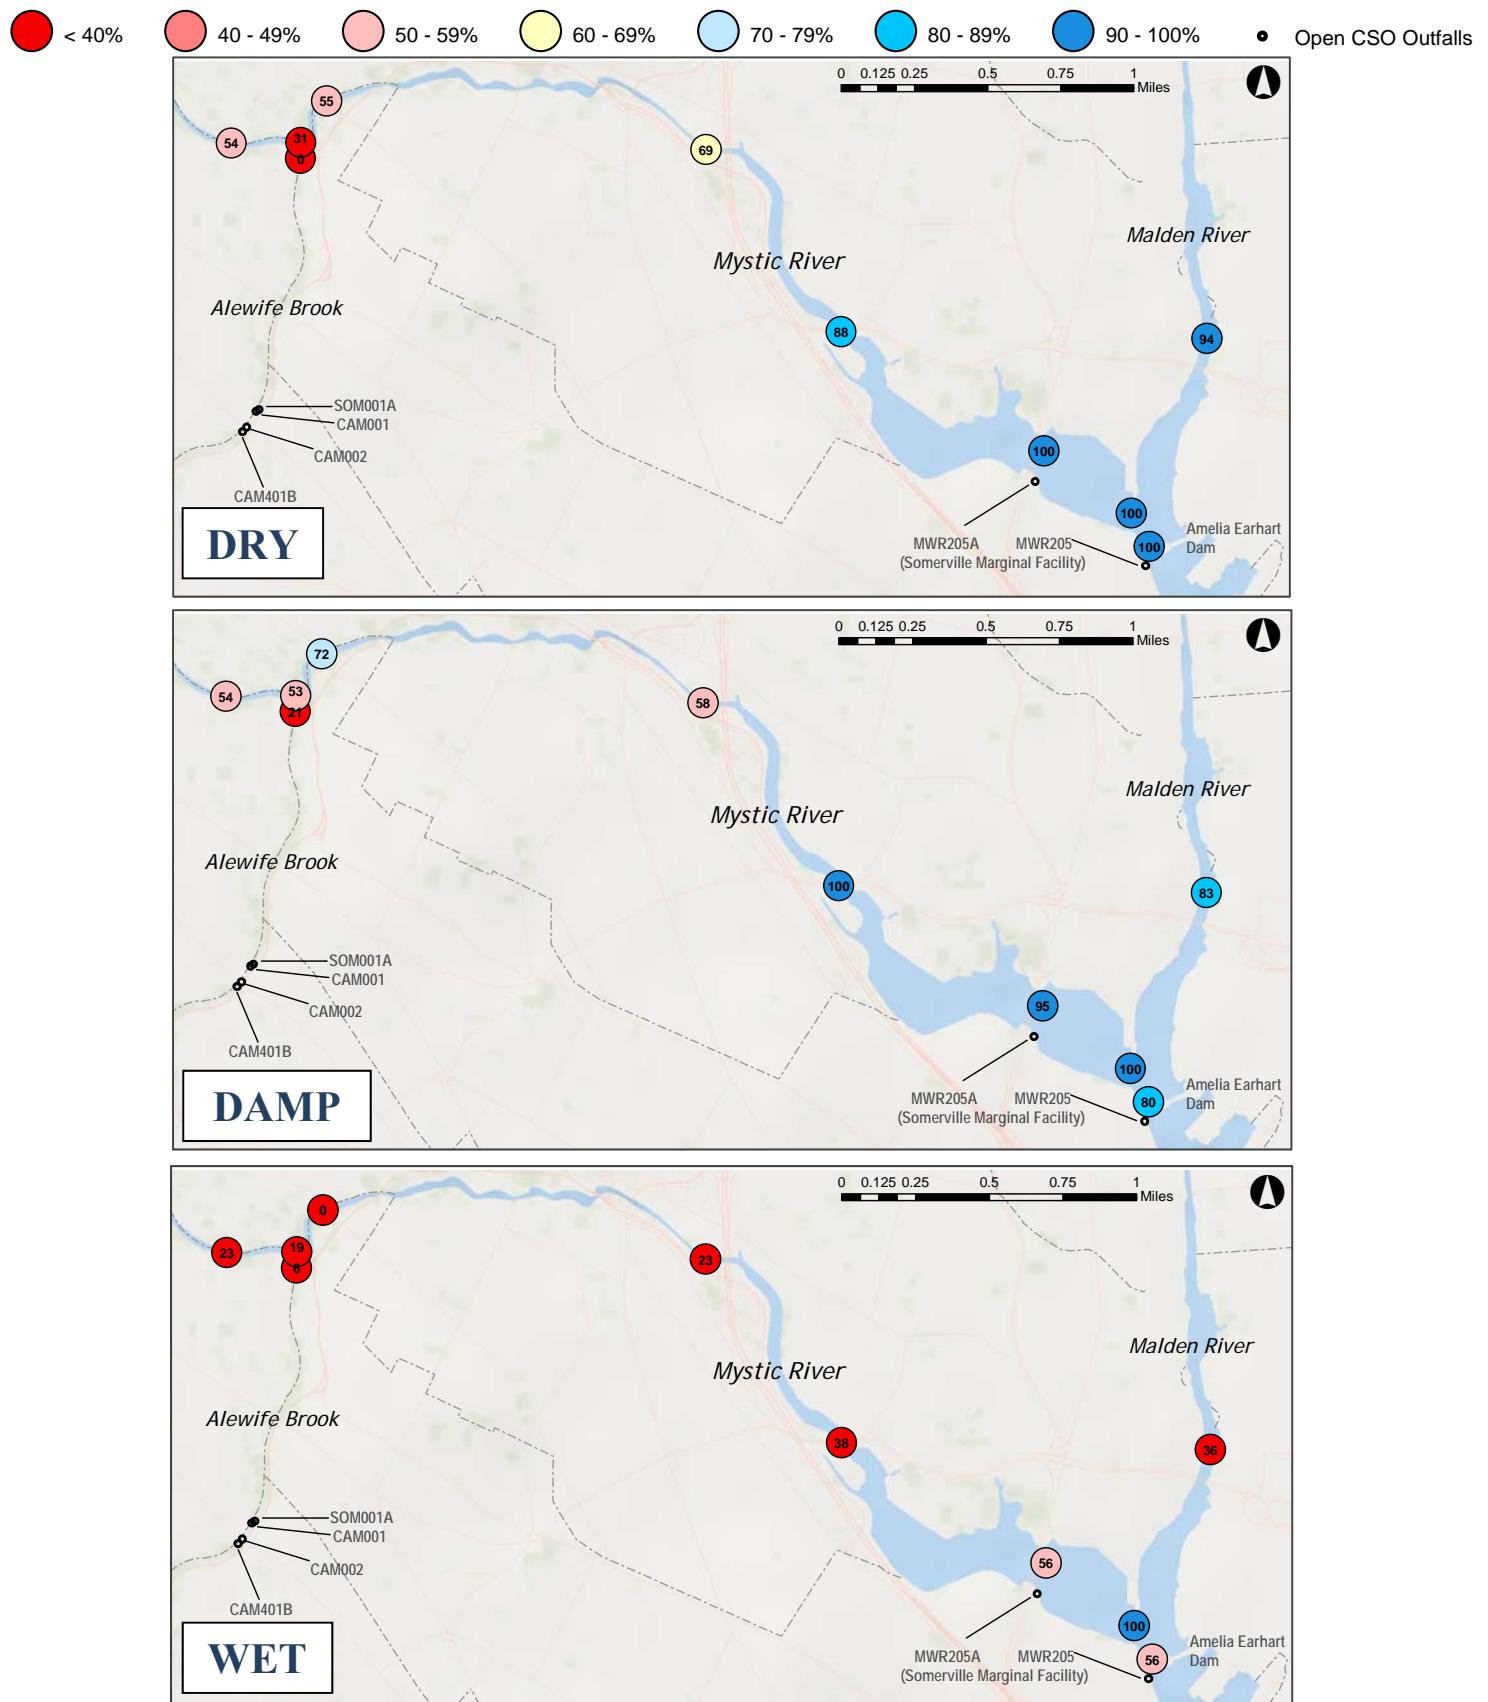

**Figure 4-9. Enterococcus over time, Alewife Brook by phase of CSO LTCP and rainfall condition.**

Dashed line shows State geometric mean standard (33 MPN/100mL), dotted line shows single sample standard (61 MPN/100mL). Data includes results for stations 174, 074, 277, 172, 276 and 070. Rainfall is NOAA rainfall from Logan airport. “Dry”: no rainfall for previous 3 days; “Heavy”: more than 0.5 inches in previous 3 days; “Damp” and/or rain distant in time: any rain < 0.15 inches at least two or three days previous to sampling and/or 0.1 inches in previous day; “Light rain”: between 0.1 and 0.5 inches in previous day and/or between 0.15 and 0.5 in two previous days.

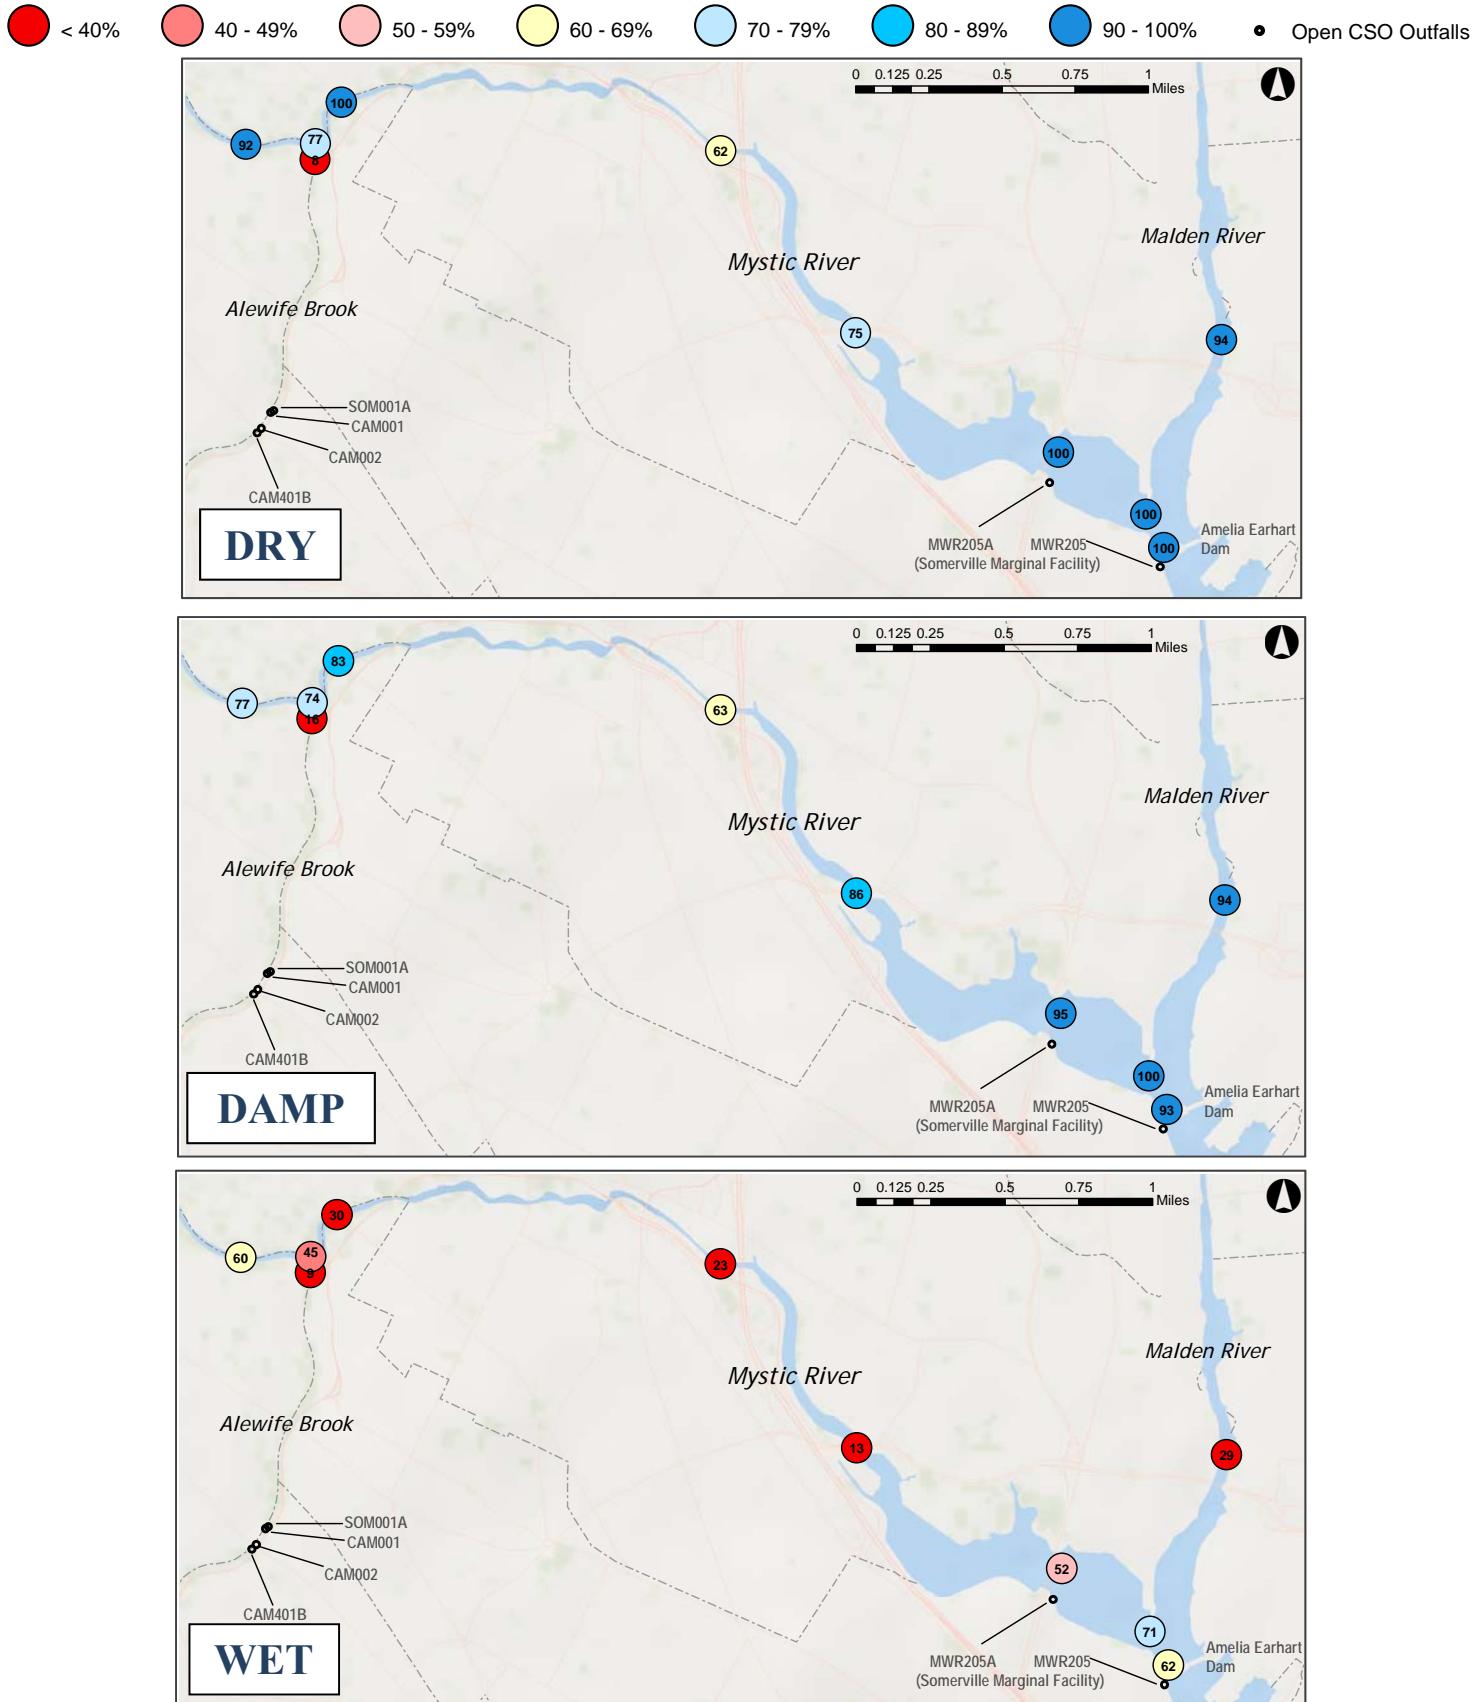

**Figure 4-10. Enterococcus over time, Mystic River by phase of CSO LTCP and rainfall condition.**

Dashed line shows State geometric mean standard (33 MPN/100mL), dotted line shows single sample standard (61 MPN/100mL). Data includes results for all Mystic River stations in Table 4-1 excepting Alewife Brook. Rainfall is NOAA rainfall from Logan airport. “Dry”: no rainfall for previous 3 days; “Heavy”: more than 0.5 inches in previous 3 days; “Damp” and/or rain distant in time: any rain < 0.15 inches at least two or three days previous to sampling and/or 0.1 inches in previous day; “Light rain”: between 0.1 and 0.5 inches in previous day and/or between 0.15 and 0.5 in two previous days.

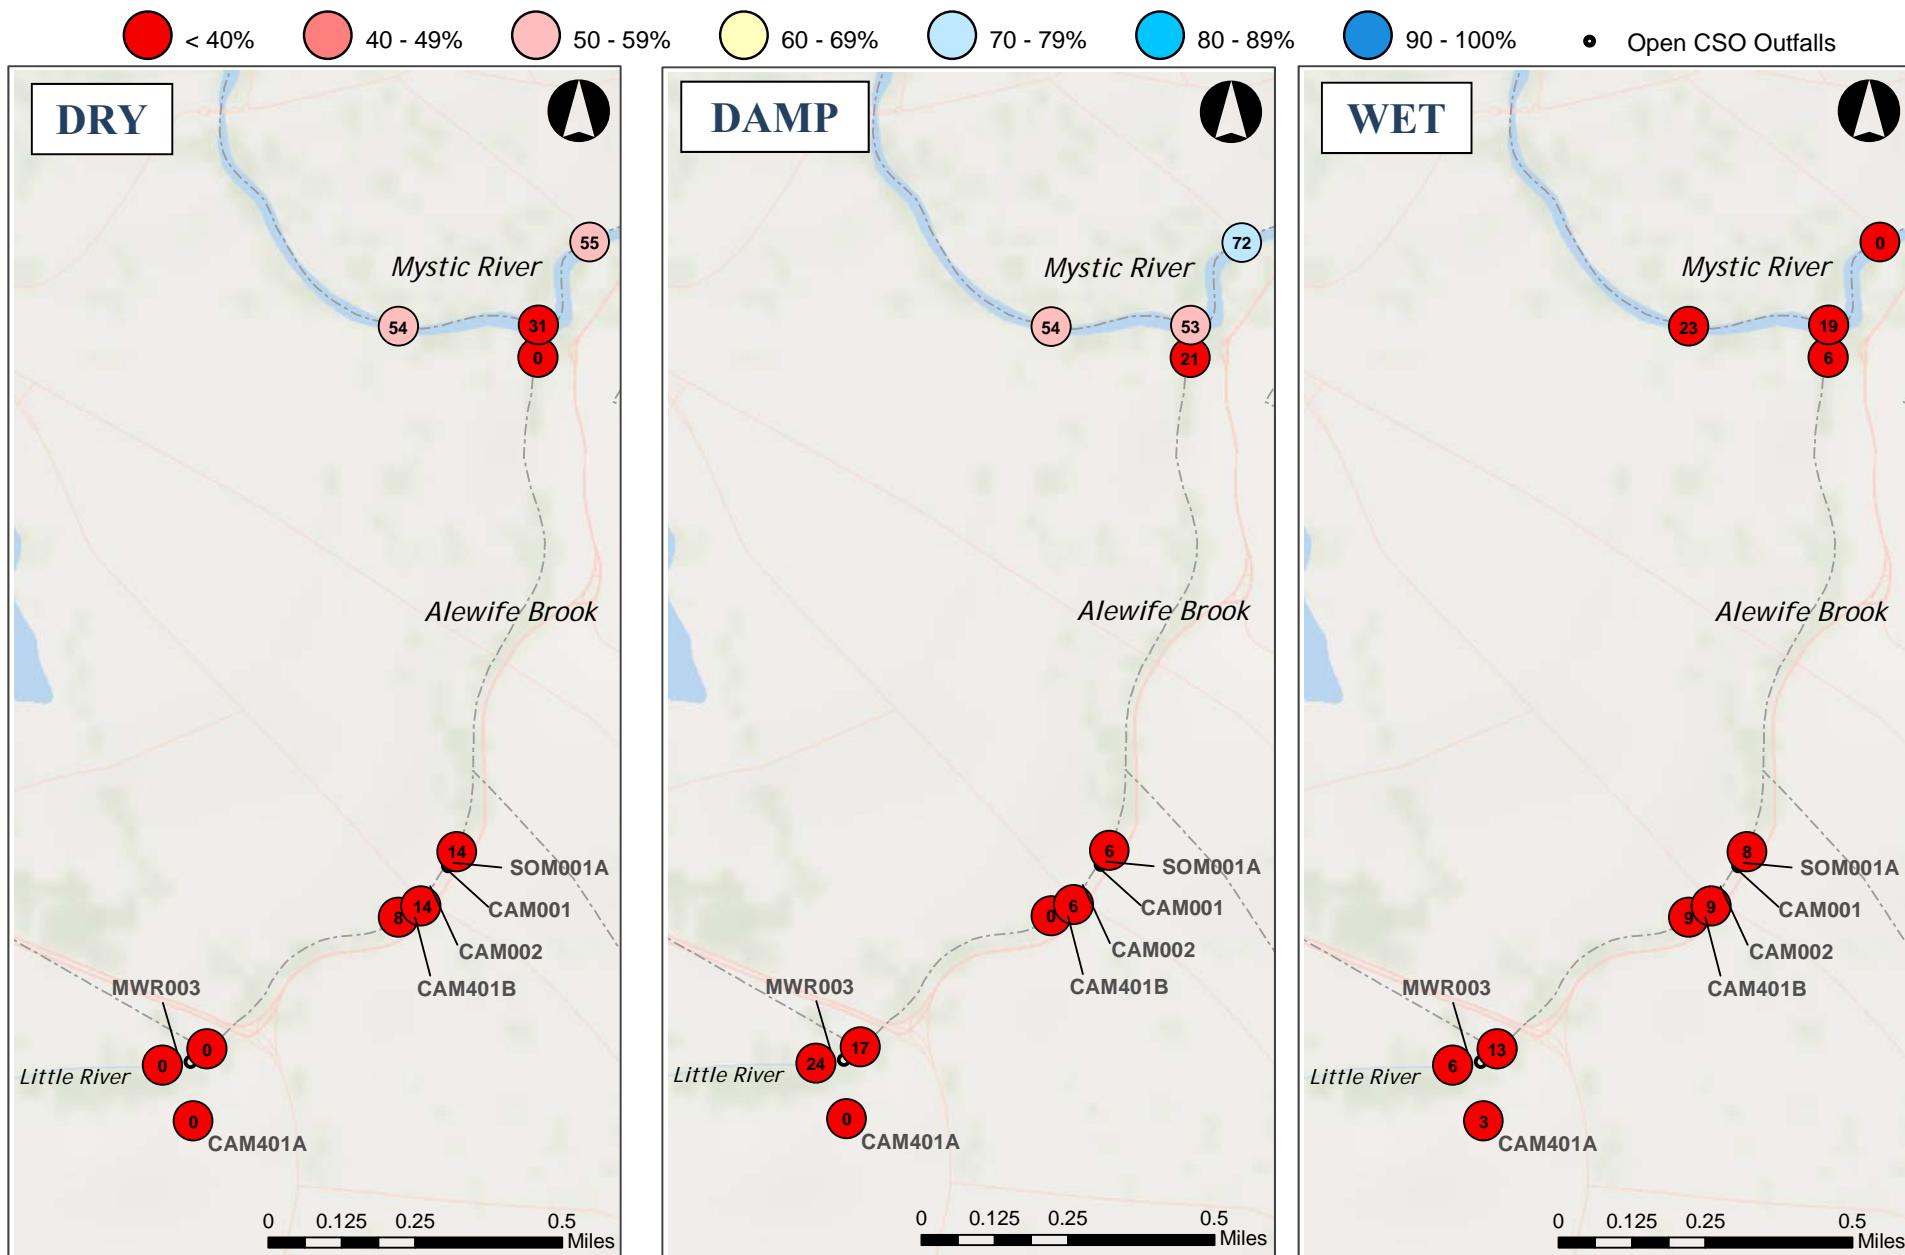

**Figure 4-11. Mystic River *Enterococcus* percent compliance by weather condition, 2019.**

Compliance with 61 MPN/100mL single sample State standard. Rainfall is from nearest rain gauge to station. Dry: no rainfall for previous 3 days; Wet: > 0.5" previous 3 days or > 0.15" previous two days; Damp is everything in between. Alewife Brook station 070 near Mystic River confluence included for reference.

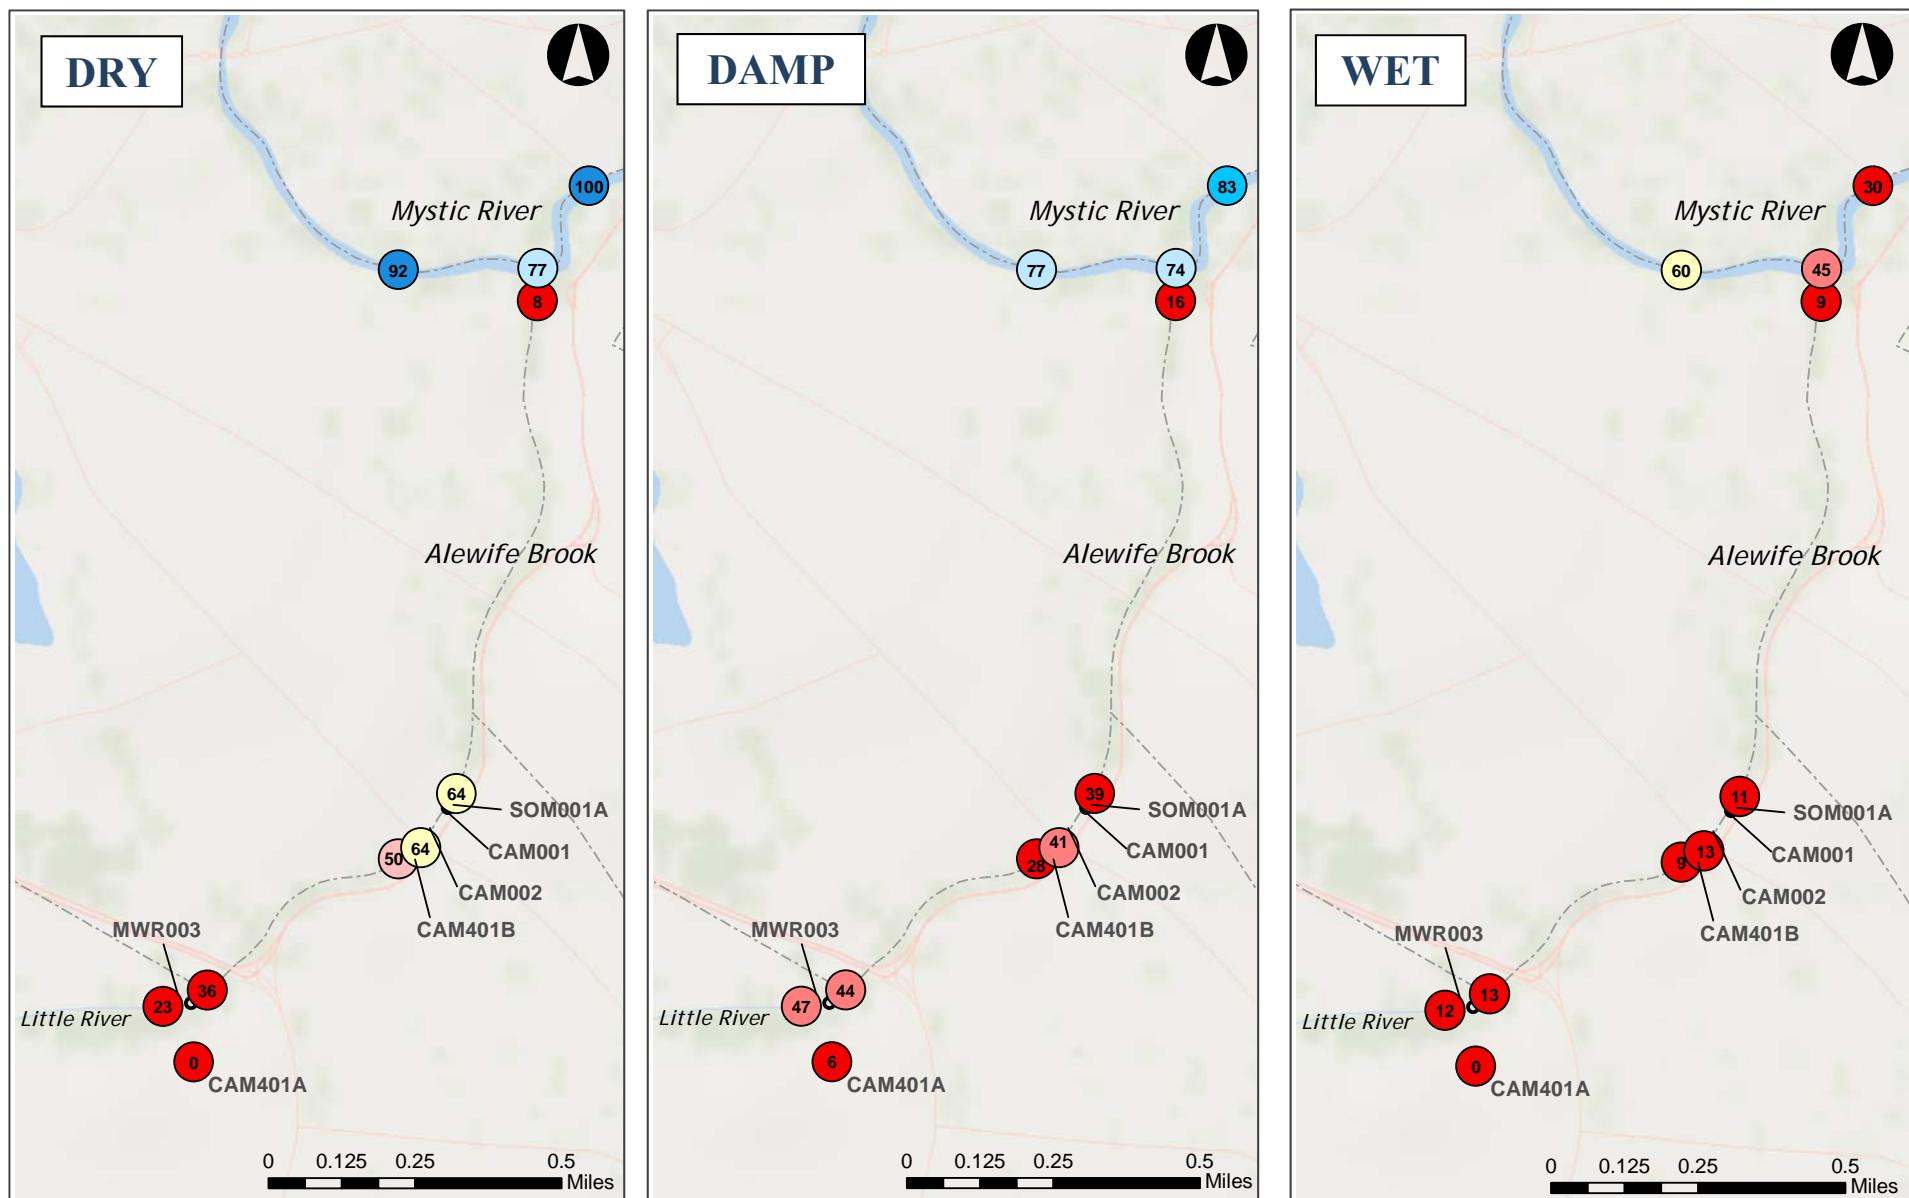

**Figure 4-12. Mystic River *E. coli* percent compliance by weather condition, 2019.**

Compliance with 235 MPN/100mL single sample State standard. Rainfall is from nearest rain gauge to station. Dry: no rainfall for previous 3 days; Wet: > 0.5" previous 3 days or > 0.15" previous two days; Damp is everything in between. Alewife Brook station 070 near Mystic River confluence included for reference.

**Figure 4-13. Alewife Brook *Enterococcus* percent compliance by weather condition, 2019.**

Compliance with 61 MPN/100mL single sample State standard. Rainfall is from nearest rain gauge to station. Dry: no rainfall for previous 3 days; Wet: > 0.5" previous 3 days or > 0.15" previous two days; Damp is everything in between. Mystic River stations 083, 057, and 066 included for reference.

**Figure 4-14. Alewife Brook *E. coli* percent compliance by weather condition, 2019.**

Compliance with 235 MPN/100mL single sample State standard. Rainfall is from nearest rain gauge to station. Dry: no rainfall for previous 3 days; Wet: > 0.5" previous 3 days or > 0.15" previous two days; Damp is everything in between. Mystic River stations 083, 057, and 066 included for reference.

#### *4.5 Summary of Mystic River/Alewife Brook water quality*

In general, bacterial water quality in the Mystic River and Alewife Brook was similar in pattern to recent years, with elevated counts due to the frequency of rain events and targeted sampling directly following them. *Enterococcus* and *E. coli* counts in 2019 were generally higher than the previous five years. Bacteria concentrations in the Mystic River met standards for much of the upper and lower Mystic Basin and Mystic River mouth in dry and damp weather, but did not meet standards in wet weather conditions at most locations aside from the Lower Mystic Basin. Bacteria concentrations in Alewife Brook fail to meet standards in any weather condition both upstream and downstream of CSOs in that region. Station 174, which is upstream of all CSOs, had poor water quality. Newly added station 308, downstream of CSO outfall CAM401A, had elevated counts in dry weather.

With the exception of Alewife Brook, most locations in the Mystic River met *Enterococcus* and *E. coli* geometric mean limits in dry and damp conditions. While the Alewife did not meet *Enterococcus* or *E. coli* standards in dry or wet weather, conditions in the main stem downstream of the Alewife/Mystic confluence suggest a limited influence of Alewife Brook on bacterial water quality in the Mystic River.

In 2019, surface DO conditions met standards at all Mystic River stations. Bottom water DO concentrations were occasionally below state standards during summer months. Clarity results were generally low or too shallow to be measured.

2019 nutrient levels were largely similar to previous years, with monthly concentrations near long-term averages. Summer chlorophyll *a* values were lower than the previous 5-year average, with peak 2019 chlorophyll *a* values recorded in the fall.

## 5 Storm Sampling Summary

Beginning in 2017, MWRA instituted a comprehensive storm sampling program building on the routine monitoring program which has been in place since 1989. The two primary enhancements were sampling on weekends in addition to weekdays during and after storm events to minimize data gaps, and the utilization of a subset of sampling locations that can be sampled from shore in the event of inclement weather that would prevent, for safety reasons, the usual method of sampling from boat. A given region was typically sampled for five consecutive days following a rain event, unless an additional storm in that period spurred a schedule adjustment. Finally, storm sampling was given a high priority, so sampling in the aftermath of a storm frequently “bumped” other sampling projects into lower places in the queue.

While maintaining sampling programs in Boston Harbor, Massachusetts Bay, and the Neponset River, MWRA has sampled 33 storms in the Mystic/Alewife and Charles regions in the past two years. These storms span a wide array of rainfall patterns and CSO events. The storm counts in 2018 and 2019 were slightly above the Typical Year, facilitating a large sample size of bacteria results to be used in receiving water model calibration.

### 5.1 2018-2019 bacteria counts by time period and storm size

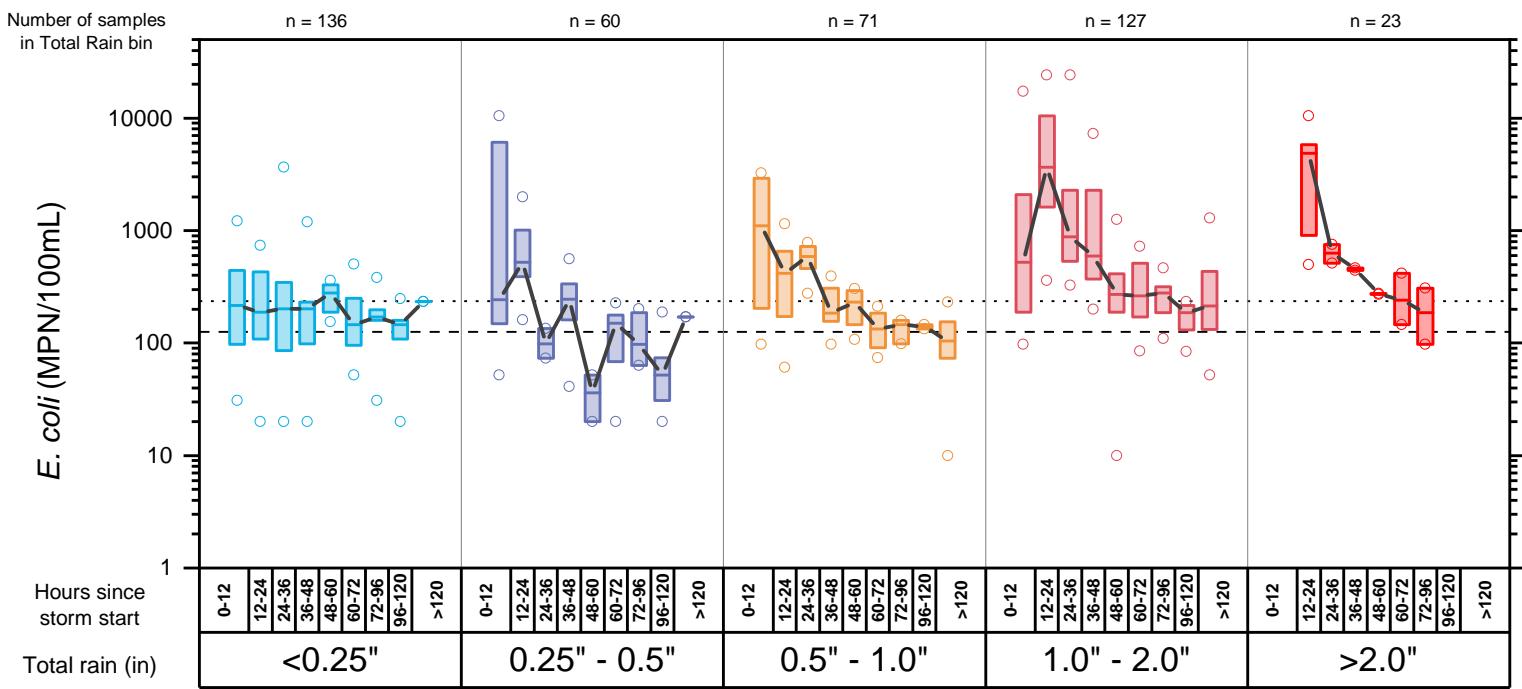

Figures 5-1 through 5-8 present bacteria counts for both *E. coli* and *Enterococcus* in the Charles and Mystic/Alewife regions following varied storm events. Results are binned first by the total rainfall of the most recent storm at a station’s nearest rain gauge, and then by the hours after the start of that storm that the sample was collected. This allows a comparison of the magnitude and duration of wet weather impacts by region, bacterial indicator, and storm size. The bins for total rainfall are dictated by those in the Typical Year (Table 1-1), and hours after storm are in 12-hour increments up to 3 days, then by 24-hours to 5 days and beyond. Lines are drawn between the median lines of each box to emphasize the pattern of wet weather impact and recovery. Note that these are percentile plots as explained by Figure 2-1, but as the number of samples is smaller, the 10<sup>th</sup> and 90<sup>th</sup> percentile “whiskers” have been omitted. Due to the high counts in Alewife Brook, the vertical axis scale is higher for the Mystic/Alewife figures.

#### 5.1.1 Charles River

For the Charles River, the results described above are further grouped by region. The following Figures 5-1 and 5-3 (top) contain results from stations upstream of any CSO outfalls, while the bottom Figures 5-2 and 5-4 include stations from the CAM005 CSO outfall to the Charles River Dam. Approximately 400 results are included in the upstream figures, and 1200 results in the downstream figures. Sample counts are highest in storms <0.25” and lowest in storms >2.0” due to the relative frequency of these events.

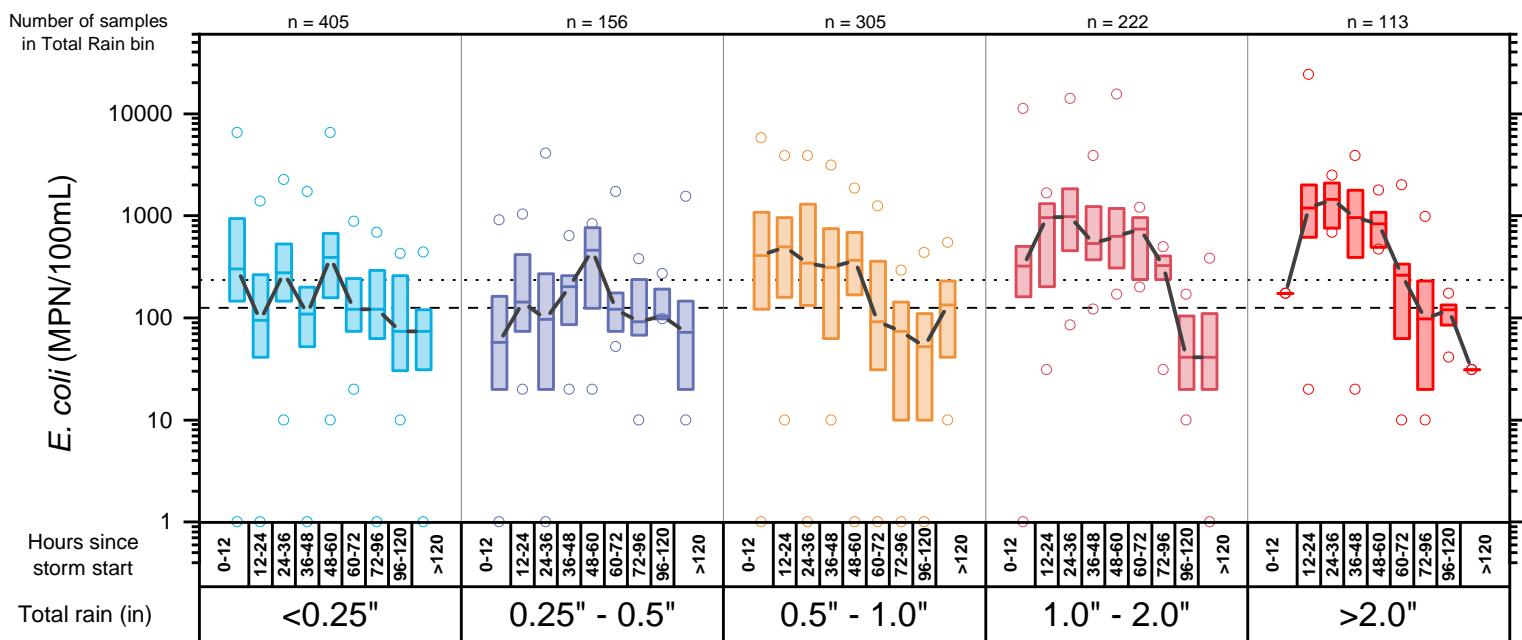

As seen in the top figures, locations upstream of CSOs show high bacteria counts from non-CSO sources in storms >0.25”. Locations downstream of CSOs in the Lower Charles showed minimal contamination in storms below 0.5”. Both indicator bacteria display a similar pattern relative to their respective standards. Peak concentrations tended to occur within 24 hours after the onset of rain, when stormwater and potential CSO impacts would be at their greatest. The magnitude of impact was higher in the region upstream of all CSOs. As expected, the duration of impact increased with storm size, with results typically returning to baseline around 72 hours, even in the largest storms. The greatest magnitude and

duration of impact was observed in 1.0 – 2.0” storms; the lower apparent impact from storms >2.0” may be due to increased dilution, or low sample size.

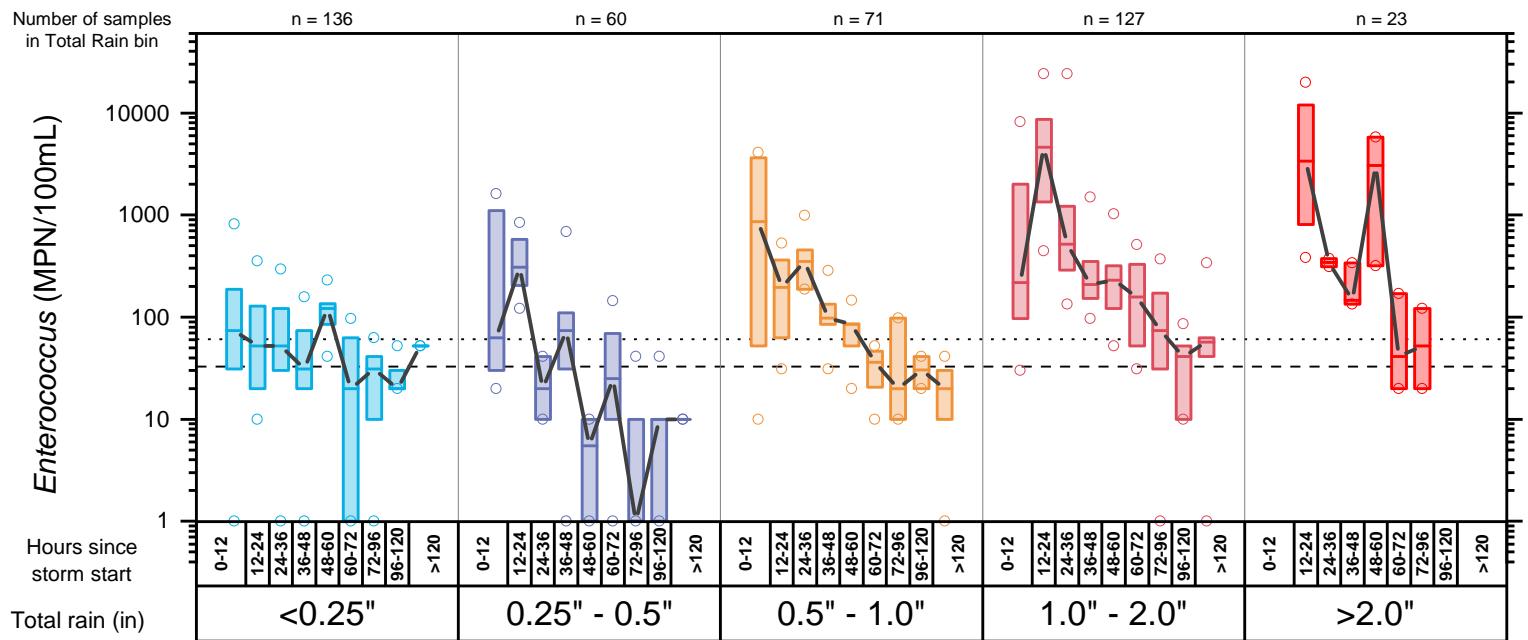

**Figure 5-1. 2018-2019 *E. coli* counts at Charles River stations upstream of all CSOs by storm size and hours after start of rain.**

Dashed line shows MADEP freshwater geometric mean standard of 126 MPN/100mL for *E. coli*; dotted line shows the single sample standard of 235 MPN/100mL. Total rain is rainfall from nearest MWRA, BWSC or USGS rain gauge to a given location. Total rain is binned to follow Typical Year rainfall categories. Hours since storm start is taken from the onset of rain to the time of sample collection. All four stations upstream of the CAM005 CSO outfall are included (012, 001, 144, 002).

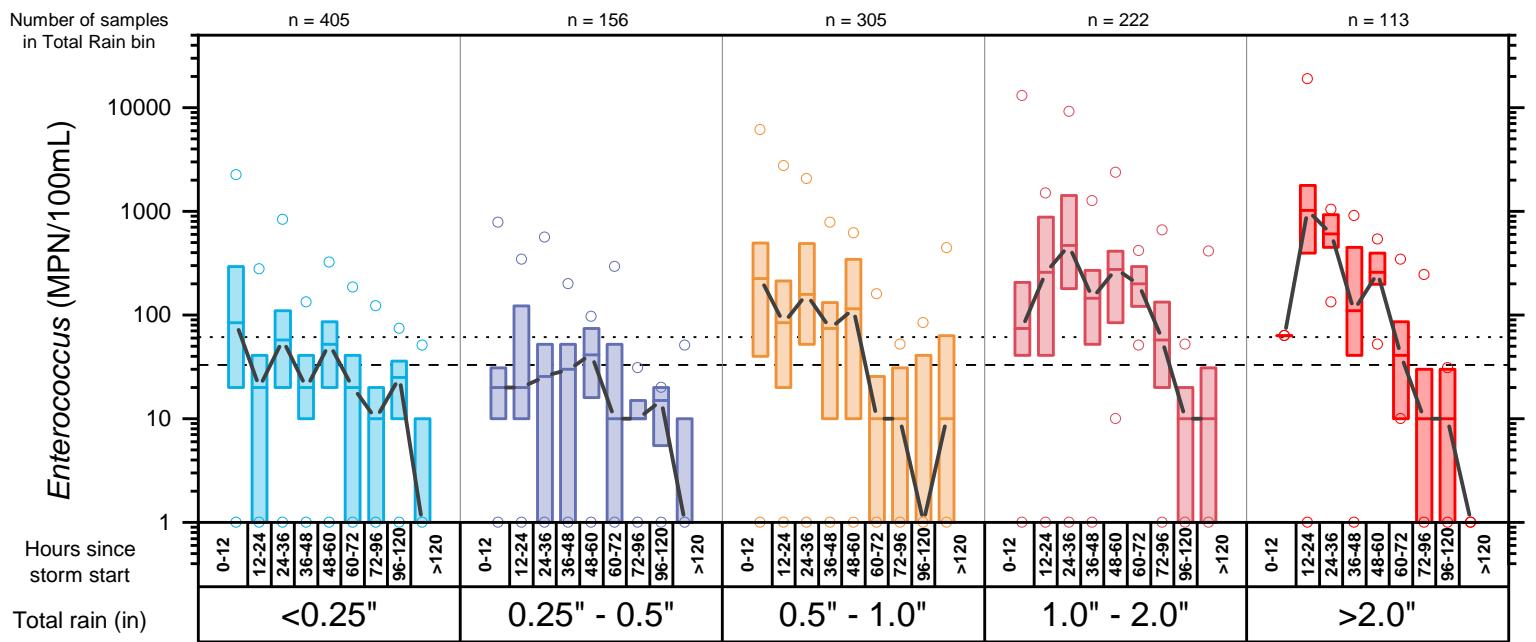

**Figure 5-2. 2018-2019 *E. coli* counts at Charles River stations in reaches downstream of CSOs by storm size and hours after start of rain.**

Dashed line shows MADEP freshwater geometric mean standard of 126 MPN/100mL for *E. coli*; dotted line shows the single sample standard of 235 MPN/100mL. Total rain is rainfall from nearest MWRA, BWSC or USGS rain gauge to a given location. Total rain is binned to follow Typical Year rainfall categories. Hours since storm start is taken from the onset of rain to the time of sample collection. All 13 stations downstream of the CAM005 outfall are included. All storms are included, both with and without CSO discharges.

**Figure 5-3. 2018-2019 Enterococcus counts at Charles River stations upstream of all CSOs by storm size and hours after start of rain.**

Dashed line shows MADEP freshwater geometric mean standard of 33 MPN/100mL for *Enterococcus*; dotted line shows the single sample standard of 61 MPN/100mL. Total rain is rainfall from nearest MWRA, BWSC or USGS rain gauge to a given location. Total rain is binned to follow Typical Year rainfall categories. Hours since storm start is taken from the onset of rain to the time of sample collection. All four stations upstream of CAM005 CSO outfall are included (012, 001, 144, 002).

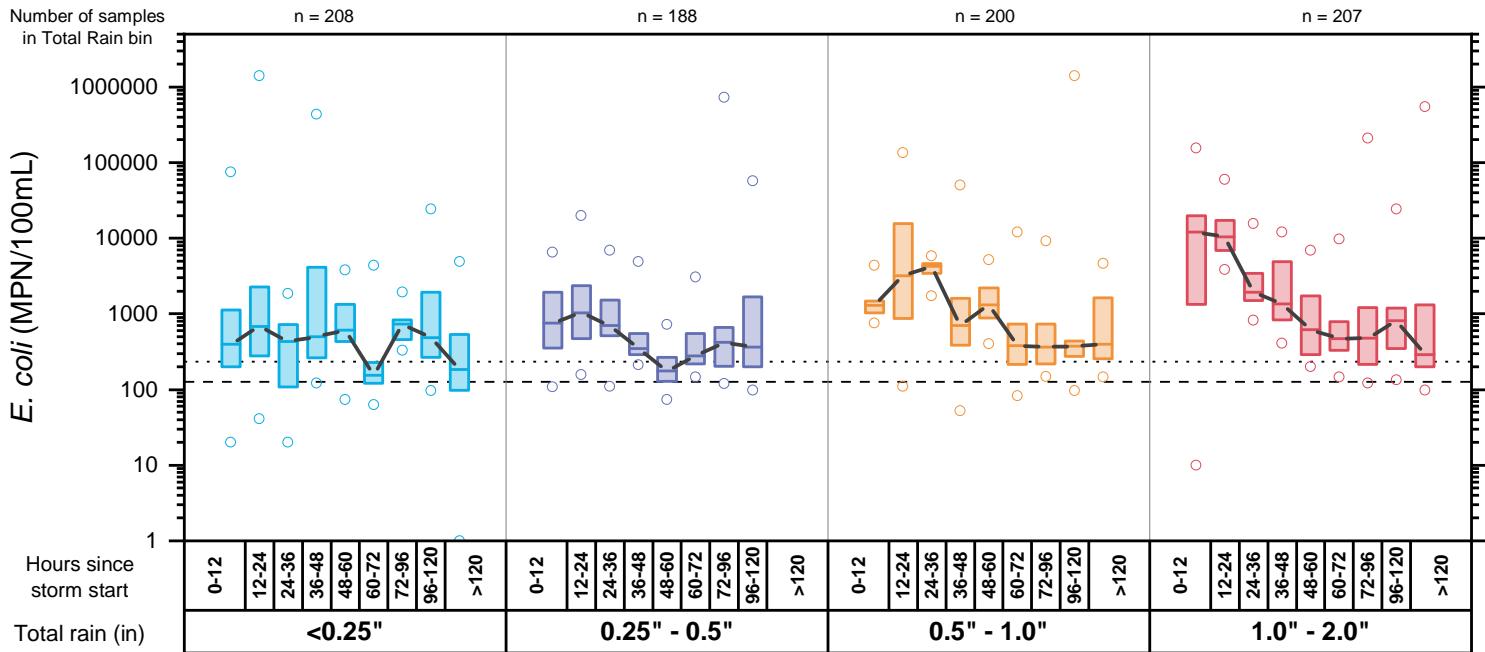

**Figure 5-4. 2018-2019 Enterococcus counts at Charles River stations in reaches downstream of CSOs by storm size and hours after start of rain.**

Dashed line shows MADEP freshwater geometric mean standard of 33 MPN/100mL for *Enterococcus*; dotted line shows the single sample standard of 61 MPN/100mL. Total rain is rainfall from nearest MWRA, BWSC or USGS rain gauge to a given location. Total rain is binned to follow Typical Year rainfall categories. Hours since storm start is taken from the onset of rain to the time of sample collection. All 13 stations downstream of CAM005 CSO outfall are included. All storms are included, both with and without CSO discharges.

### 5.1.2 Mystic River & Alewife Brook

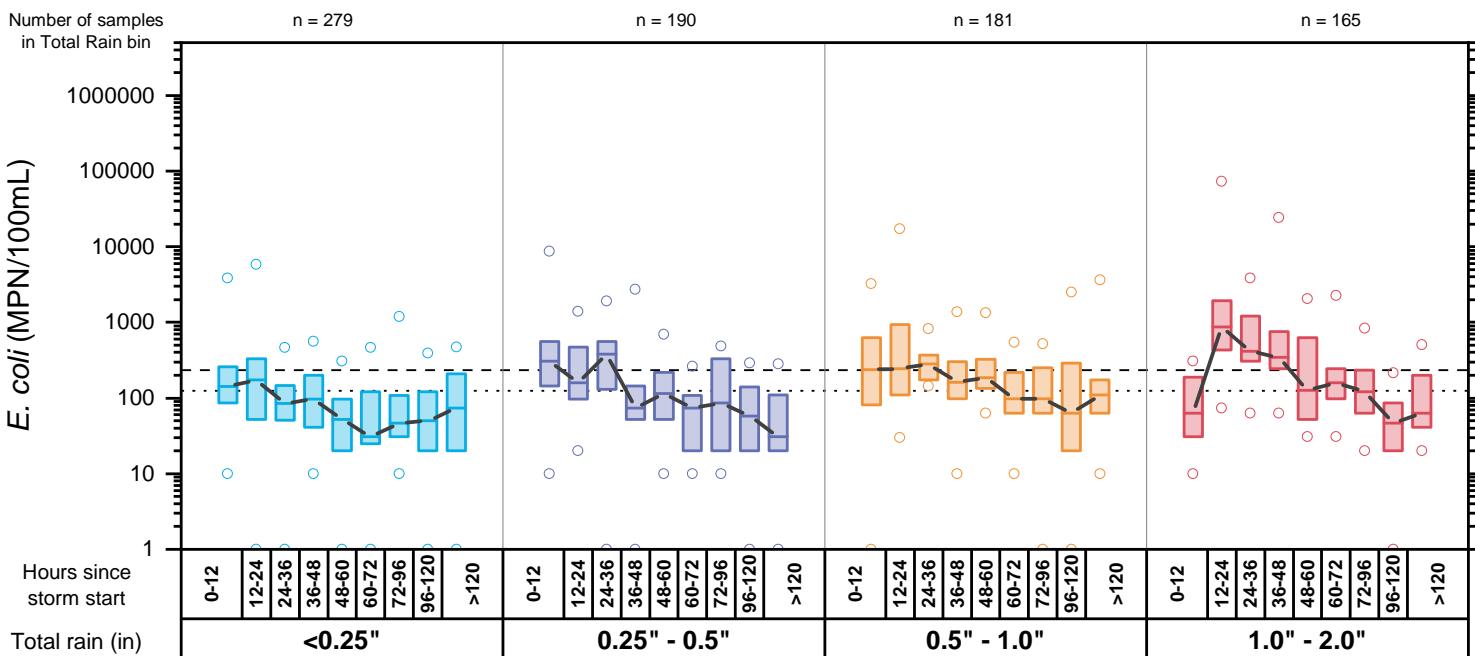

The following Figures 5-5 and 5-7 (top) contain results from all Alewife Brook stations, while the bottom Figures 5-6 and 5-8 include all freshwater Mystic River stations. There were no storms greater than 2.0" sampled in this region. Sample counts are evenly distributed between storm sizes.

The recovery patterns of bacterial water quality impact are similar between the two indicator species. As discussed in Chapter 4, stations in Alewife Brook often fail to meet state standards in all weather conditions, so the wet weather impacts here should be evaluated by a return to baseline conditions approximated by the >120 hour category. Alewife Brook exhibits a sharper increase and decrease in bacteria counts than the Mystic River, as flows increase dramatically in the shallow, narrow Alewife Brook during storms. The Mystic River only exhibited a sharp peak in water quality impact in storms over 1". As expected, the largest storms resulted in the greatest bacteria counts and duration of impact, with results still returning to baseline within 2-3 days of the storm start.

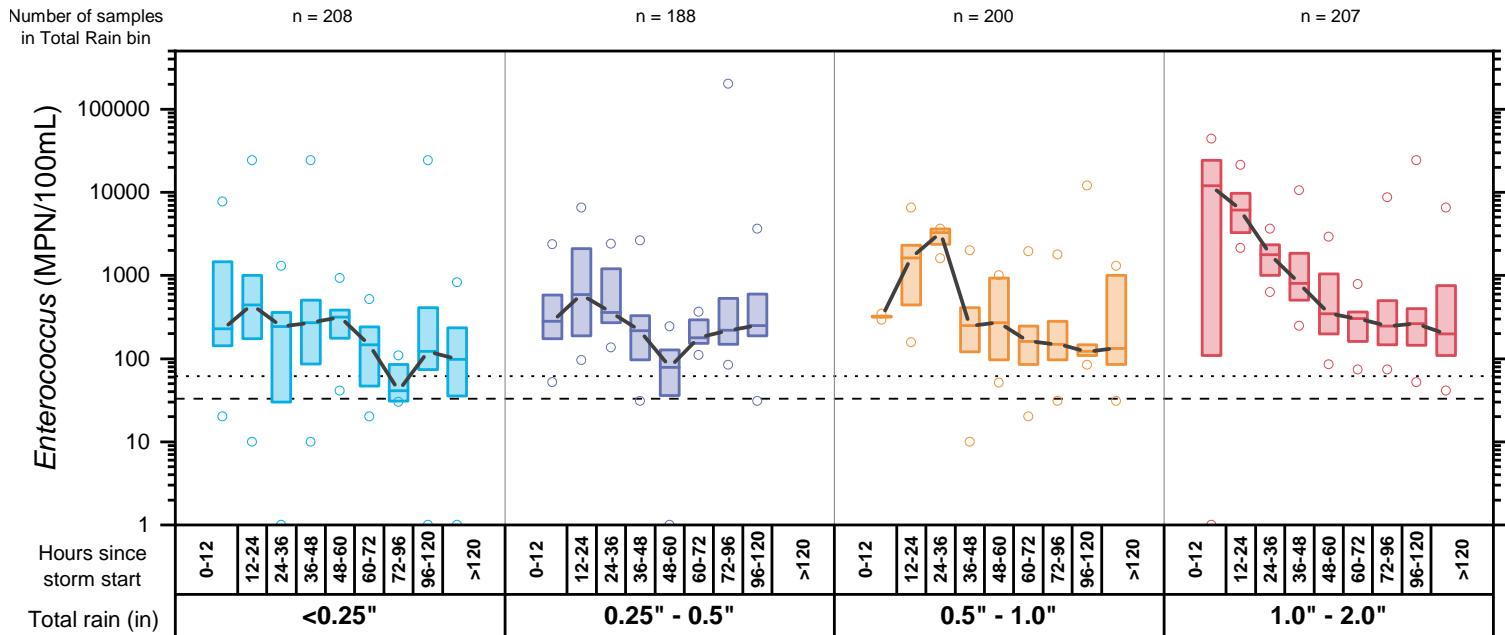

**Figure 5-5. 2018-2019 *E. coli* counts in Alewife Brook by storm size and hours after start of rain.**

Dashed line shows MADEP freshwater geometric mean standard of 126 MPN/100mL for *E. coli*; dotted line shows the single sample standard of 235 MPN/100mL. Total rain is rainfall from nearest MWRA, BWSC or USGS rain gauge to a given location. Total rain is binned to follow Typical Year rainfall categories. Hours since storm start is taken from the onset of rain to the time of sample collection.

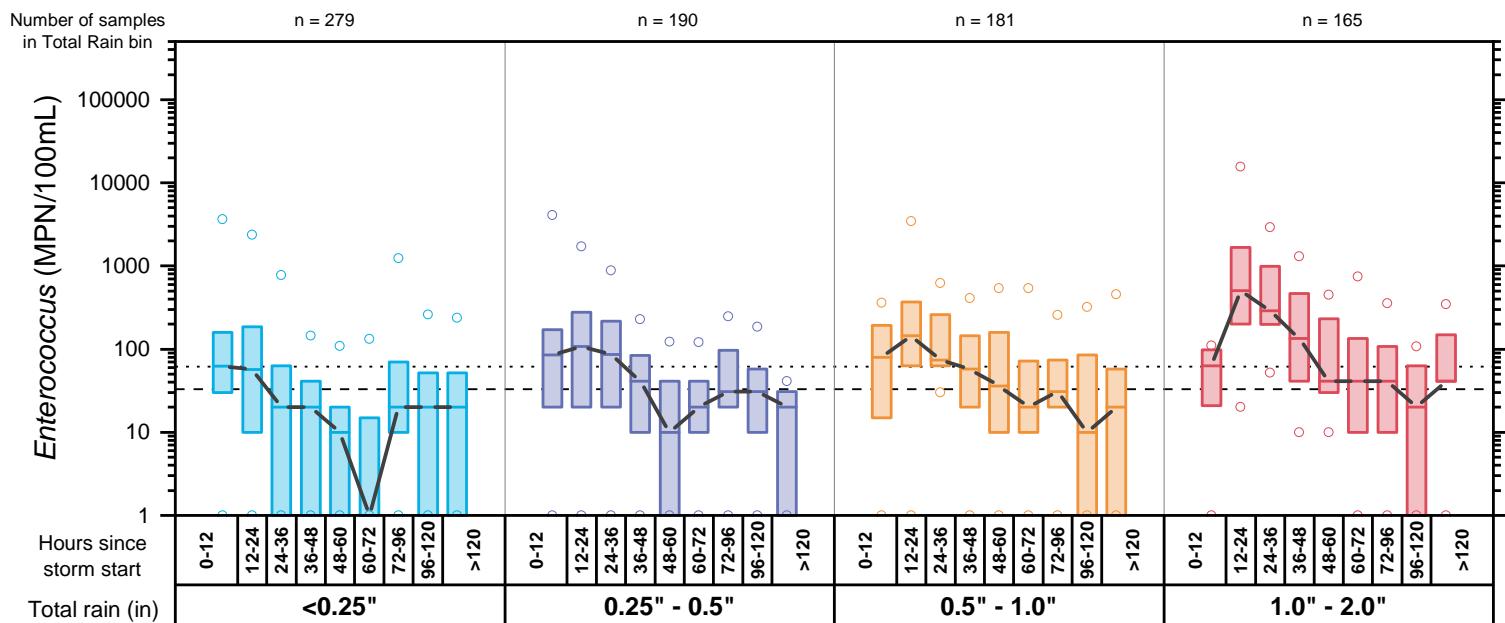

**Figure 5-6. 2018-2019 *E. coli* counts in the Mystic River by storm size and hours after start of rain.**

Dashed line shows MADEP freshwater geometric mean standard of 126 MPN/100mL for *E. coli*; dotted line shows the single sample standard of 235 MPN/100mL. Total rain is rainfall from nearest MWRA, BWSC or USGS rain gauge to a given location. Total rain is binned to follow Typical Year rainfall categories. Hours since storm start is taken from the onset of rain to the time of sample collection. Alewife Brook and Malden River stations not included.

**Figure 5-7. 2018-2019 Enterococcus counts in Alewife Brook by storm size and hours after start of rain.**

Dashed line shows MADEP freshwater geometric mean standard of 33 MPN/100mL for *Enterococcus*; dotted line shows the single sample standard of 61 MPN/100mL. Total rain is rainfall from nearest MWRA, BWSC or USGS rain gauge to a given location. Total rain is binned to follow Typical Year rainfall categories. Hours since storm start is taken from the onset of rain to the time of sample collection.

**Figure 5-8. 2018-2019 Enterococcus counts in the Mystic River by storm size and hours after start of rain.**

Dashed line shows MADEP freshwater geometric mean standard of 33 MPN/100mL for *Enterococcus*; dotted line shows the single sample standard of 61 MPN/100mL. Total rain is rainfall from nearest MWRA, BWSC or USGS rain gauge to a given location. Total rain is binned to follow Typical Year rainfall categories. Hours since storm start is taken from the onset of rain to the time of sample collection. Alewife Brook and Malden River stations not included.

## 5.2 Storm comparisons

### 5.2.1 Charles River

This section contains a more detailed look at sampling results following two specific storm events in the Charles River in 2019. Although obviously no two storms are the same, these storms were selected because they represented two extremes of CSO discharge – The June 21 storm had minimal CSO (a 7 minute discharge at one outfall) and the August 8 storm had discharges at nearly all CSO outfalls.

#### 5.2.1.1 June 21, 2019

The June 21 storm actually followed two smaller rainfall events on June 18 and June 20. Neither of those earlier events caused any CSO discharges according to MWRA’s calibrated hydraulic model. Table 5-1 shows the rainfall characteristics of the June 21 storm, and Tables 5-2 and 5-3 show the characteristics of the smaller storms on June 18 and June 20. There was one sample taken on June 17, and the sampling run on June 18 was before all rain. Samples on June 20 were taken during the moderate rain that day. The June 21 storm started in the early morning hours, and continued into the afternoon, so that day’s sampling also occurred in the rain.

Table 5-4 shows the CSOs that discharged in the June 21 storm. The only modeled CSO activation was at regulator RE046-100 upstream of the MWR023 outfall, for only seven minutes and an estimated volume of <0.005 million gallons (MG). Discharge time and volume for that regulator are from MWRA’s calibrated hydraulic sewer system model. As previously mentioned, the model indicates that there were no CSO discharges in either the June 18 or June 20 rain events.

*Enterococcus* results for the sampling period June 17 to June 25 show a distinct peak on June 21, when samples were collected during the June 21 rain event. Interestingly, results from June 20, when it was also raining while samples are collected, did not show the same magnitude of increase. Counts from June 19, following the afternoon rain on June 18, mostly held steady from samples collected on the morning of June 18, with the exception of a spike at stations 007 and 008 in the mid-Basin. From June 17 to 20, nearly all samples met the state standard of 61 colonies/100mL except for locations in the Upper Basin.

June 21 sampling results showed increases in counts at nearly all locations, with the Upper Basin locations showing the highest counts. Station 006 in the Mid-Basin also showed a substantial increase. This location is downstream of the Cottage Farm facility, which did not discharge during this storm or in the previous two storms on June 18 and 20. Counts at station 145, which is directly downstream of the MWR023 outfall, were high, but lower than results at any of the Upper Basin locations and 006, none of which had any CSO influence in the storms during the sampling period. As noted above, only one of the regulators in the MWR023 system activated, and then only for a few minutes. Discharges from MWR023 are primarily stormwater, even during a CSO activation of one of the many regulators in its system.

Samples collected from June 22 to 25 were during a period of dry weather. Counts generally declined at all locations until June 24 with the exception of spikes at 007 and 145 on June 22, and 011 on June 23.

By June 24, all locations in the Mid-Basin and Lower Basin met state standards. A majority of the locations in the Upper Basin still did not meet standards. There was a minor increase in counts at a number of locations throughout the river on June 25.

*E. coli* counts showed much the same pattern as *Enterococcus*. Counts in the Upper Basin met the state standard of 235 colonies/100mL at about half the locations before the June 21 storm. After that storm, counts spiked to very high levels. The upper reaches of the Upper Basin – where there is no CSO – saw the highest counts. Stations 006 and 145 also saw high counts on June 21. The result at 145 was lower than any of the Upper Basin stations, despite the small CSO discharge from MWR023.

After that peak on June 21, counts declined at the Upper Basin locations for the rest of the sampling period. In the Mid-Basin, there was a mild increase leading to a small peak on June 23. This was not really seen in the *Enterococcus* data. By June 25, nearly all the stations met the state standard. The ones that did not – 001 and 145 – are spatially quite distant from each other so it is unlikely high counts at those locations are related to each other.

**Table 5-1. Rainfall Characteristics for June 21, 2019 Storm.**

Gauge	Storm Start (June 21, EST)	Storm End (June 21, EST)	Duration (hrs)	Total Rainfall (in)	Peak Intensity (in/15 min)	Peak Intensity (in/hr)
Ward St (MWRA)	01:45	15:00	13.25	0.83	0.26	0.64
Longwood (BWSC) <sup>1</sup>	01:45	08:15	6.5	0.76	0.21	0.59
Charlestown (BWSC)	01:45	05:00	3.25	0.76	0.26	0.65
Fresh Pond (USGS) <sup>2</sup>	6/20 07:00	16:00	33	1.02	0.24	0.44

<sup>1</sup> The BWSC Allston gauge was out of service for this storm. Data was substituted from the BWSC Longwood gauge (BWSC008).

<sup>2</sup> This storm is the same storm that is also in Table 5-3.

**Table 5-2. Rainfall Characteristics for June 18, 2019 Storm.**

Gauge	Storm Start (June 18, EST)	Storm End (June 18, EST)	Duration (hrs)	Total Rainfall (in)	Peak Intensity (in/15 min)	Peak Intensity (in/hr)
Ward St (MWRA)	13:15	16:45	3.5	0.1	0.02	0.07
Longwood (BWSC) <sup>1</sup>	13:15	16:30	3.25	0.09	0.02	0.06

Distribution plot of bacteria samples (both *Enterococcus* and *E. coli*) collected before and after the June 21 storm. The dotted line shows the MADEP *Enterococcus* geometric mean standard and the dashed line the *E. coli* geometric mean standard.

### **5.2.1.2 August 7, 2019**

There was a major storm starting in the early afternoon of August 7 and ending in the early hours of August 8. All the rain gauges in the area recorded over two inches of rain in this storm event. Rainfall intensities were quite high, especially near the end of the storm, so there were a number of CSO discharges near the storm's end. Table 5-5 summarizes the rainfall characteristics of this storm. The Fresh Pond, Allston, and Charlestown gauges each registered a small (0.01 inches) rain event at differing times on August 8 and 9. Since the event was minor in rainfall depth and only lasted 15 minutes at each gauge, it is not presented in a table.

Table 5-6 summarizes the discharges from CSOs for this storm. A number of untreated CSO outfalls (CAM005, CAM007, CAM017, MWR018, MWR019, MWR020, MWR023) discharged according to MWRA's calibrated hydraulic model, as well as the Cottage Farm CSO Treatment Facility. For the discharge from Cottage Farm, the volume and discharge duration is from the meters at the facility. Cottage Farm effluent is screened, settled, disinfected, and dechlorinated.

Figure 5-12 shows *Enterococcus* counts from sampling done from August 8 (the morning after the storm ended) to August 13. On August 8, counts were high throughout the Upper Basin, with the highest count at station 144, upstream of any CSOs. Station 003, downstream of CAM005 – which discharged according to the calibrated hydraulic model – has the second highest counts. Elevated counts – although not as high as those in the Upper Basin – were seen further downstream at stations 006 and 145, which are downstream of Cottage Farm and MWR023, respectively. Effluent sampling for *Enterococcus* in the Cottage Farm effluent ranged from <10 to 1300 MPN/100mL (geometric mean of 14 MPN/100mL, 6 samples). This was well below the 7270 MPN/100mL sample collected at station 006 on August 8. Results at station 009, which is near MWR020, showed higher counts than normal. However, counts at station 210, at the CAM017 outfall, were below the state single sample standard.

By August 9, there was a steep decline in counts at all locations except 010 and 210, which saw modest increases, perhaps due to the natural movement of water downstream. On August 10, 60% of the samples throughout the river met the single sample standard. Of the four that did not meet standards, three were in the Upper Basin upstream of any CSOs. The fourth was station 145. Station 145 still did not meet standards, along with station 206 in the Mid-Basin and two locations in the Upper Basin, on August 11. By August 12, only station 012 and 006 did not meet standards, and only barely as both had counts of 63 MPN/100mL. August 13 was a nutrient survey so not all locations were visited, but counts at station 012 decreased enough to meet the state standard.

Figure 5-13 shows the results from the *E. coli* analyses from the same time period. For the most part, results were very similar to the *Enterococcus* results presented above. August 8 *E. coli* results were poor over the entire river, with an especially high result at station 003, downstream of CAM005. Results at station 006 downstream of Cottage Farm were high – 8660 MPN/100mL. However, effluent sampling results at Cottage Farm were at least an order of magnitude lower, ranging from <10 to 884 MPN/100mL (six samples, geometric mean of 85 MPN/100mL). Results at 145 were also elevated, but they were lower than station 007, which is upstream of MWR023. Counts at station 210, at the CAM017 outfall, were higher than the state standard, but only barely.

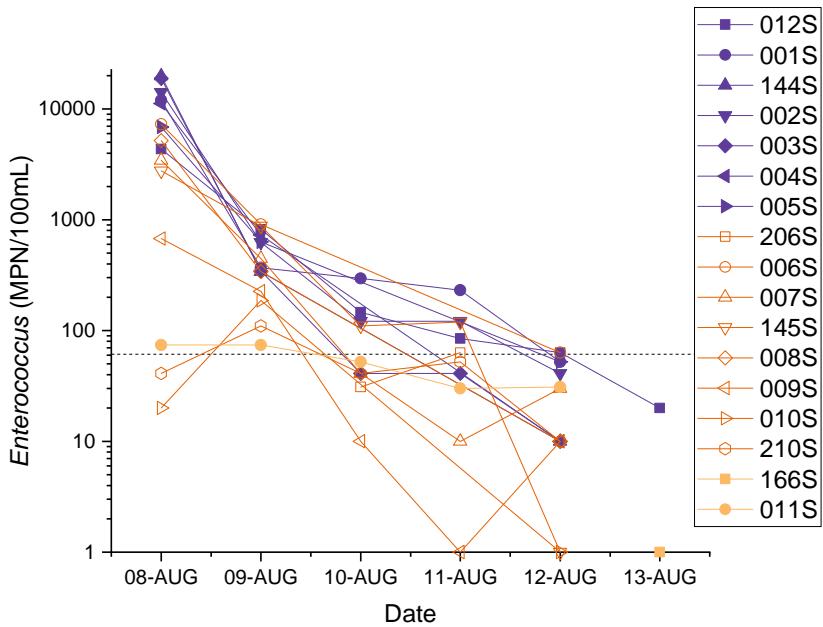

For the remainder of the sampling period, counts decreased day after day. However, whereas *Enterococcus* saw some significant differences in the magnitude of decreases based on location, *E. coli* results decreased more uniformly. By August 11, 70% of the locations met the state standard, although the three that did not were evenly spread throughout the three regions (001, 145, and 011). By August 12, all locations met the state standard except station 005.

**Table 5-5. Rainfall Characteristics for August 7, 2019 Storm.**

Gauge	Storm Start (Aug 7, EST)	Storm End (Aug 8, EST)	Duration (hrs)	Total Rainfall (in)	Peak Intensity (in/15 min)	Peak Intensity (in/hr)
Ward St (MWRA)	13:30	02:15	12.75	2.29	0.44	1.14
Allston (BWSC)	12:30	01:30	13	2.9	0.49	1.56
Charlestown (BWSC)	12:00	01:15	13.25	2.16	0.31	0.94
Fresh Pond (USGS)	12:30	01:30	13	2.98	0.61	1.41

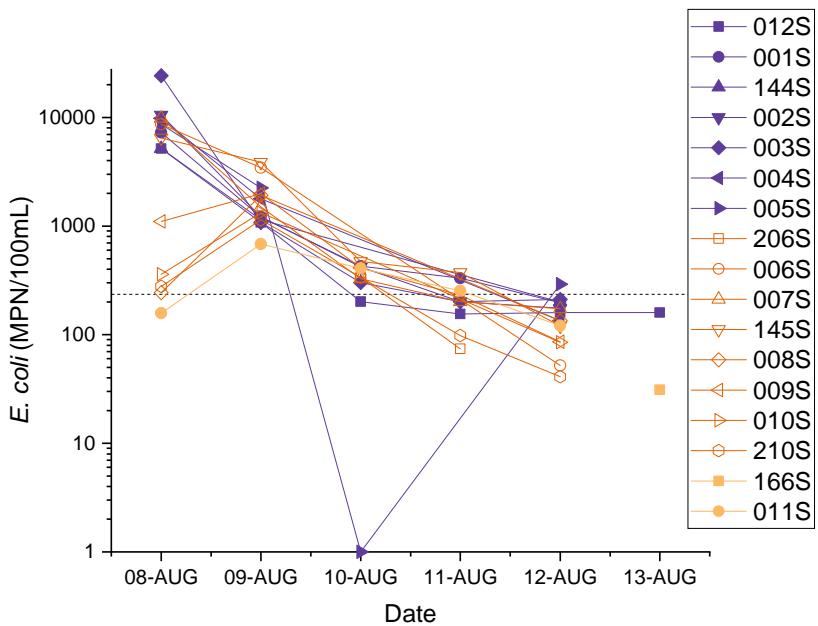

**Table 5-6. CSO Discharges in the August 7, 2019 Storm from the MWRA calibrated hydraulic model.**

Outfall	Discharge Date	Duration (hrs:min)	Volume (MG)	Notes
CAM005	8/7 22:11	3:01	0.803	
CAM007	8/7 22:30	2:45	3.147	
CAM017	8/7 0:00	1:15	0.95	
MWR018	8/7 23:30	2:15	4.071	
MWR019	8/7 23:30	2:00	2.031	
MWR020	8/7 23:15	5:30	20.711	
MWR023	8/8 0:03	0:45	0.307	Discharges from RE046-100, RE046-105, RE046-381. Discharges from MWR023 are majority stormwater.
MWR201 (Cottage Farm)	8/8 12:50	3:45	19.27	Treated discharge. Volume and duration data from facility meter.

Distribution plot of bacteria samples (both *Enterococcus* and *E. coli*) collected after the August 7 storm. The dotted line shows the MADEP *Enterococcus* geometric mean standard and the dashed line the *E. coli* geometric mean standard.

## 5.2.2 Mystic River & Alewife Brook

This section contains a more detailed look at samples following two storm events in the Mystic River and Alewife Brook in 2019. These two storm events were selected because one had numerous CSO discharges and the other did not. The August 28 storm resulted in CSO discharges at four outfalls in Alewife Brook according to MWRA's calibrated hydraulic model, as well as both outfalls of the Somerville Marginal CSO treatment facility. The November 18 storm did not result in any CSO discharges.

### 5.2.2.1 August 28, 2019

A moderately large storm passed through the area on August 28, beginning in the mid-afternoon and ended in the early hours of August 29. Although the amount of rain was not particularly high (1.13 to 1.37 inches depending on the gauge), intensities were high during the latter part of the storm, which led to a number of untreated CSO discharges in the Alewife Brook, as well as a treated discharge from MWR205A. Table 5-7 shows the rainfall characteristics of this storm.

Table 5-8 shows that, according to MWRA's calibrated hydraulic model, there were untreated CSO discharges from CAM401A, CAM401B, and SOM001A in the Alewife Brook, all around midnight of August 29. The Somerville Marginal CSO Treatment Facility also discharged through its MWR205A outfall into the freshwater portion of the Mystic. This discharge is disinfected and dechlorinated before discharge.

Sampling for this event began on August 27, so there were two days of baseline data before the post-storm sampling began. Figures 5-15 and 5-16 show the results of *Enterococcus* and *E. coli* monitoring, respectively.

Baseline results for *Enterococcus* were highly variable, including a number of results above the state standard. Counts tend to be fall in a wide range in dry weather in the Alewife Brook and Upper Mystic. Station 308 was especially high, but this was not surprising considering as this location tended to have the highest dry weather counts out of all the locations. Locations in the Lower Mystic Basin generally met the state standard during August 27-28. The previous rain was in the morning of August 23.

Samples taken the morning of August 29 clearly show an increase in *Enterococcus* counts throughout the entire basin. The highest counts in the Alewife were seen at station 308 at the CAM401A outfall and stations 172 and 276, which are downstream of the CAM401B and SOM001A outfalls, respectively. In the Upper Mystic, station 056 near Medford Square and I-93 had very high counts. There are no CSO outfalls near this location. In the Lower Mystic Basin, station 067 near the MWR205A outfall also had elevated counts, although less than the results at 056. The Malden River location, 176, also had very high counts. Treated CSO is discharged from MWR205A, although there is also stormwater that enters into the discharge conduit downstream of the CSO treatment facility.

All locations saw a significant decrease during the August 30 sampling. Locations in the Upper Mystic and Lower Mystic Basin saw a proportionally larger decrease in counts than locations in the Alewife Brook. On August 31, counts continued to decrease in the Alewife Brook but there was a significant increase at station 083 at the outlet of the Mystic Lakes, perhaps from sources upstream of the lakes. Other locations in the Upper Mystic saw small increases. By September 1, none of the Alewife Brook locations met the standard (although this is not uncommon, see Figure 4-7), along with the two furthest upstream stations in the Upper Mystic. Station 056 and locations downstream all met the *Enterococcus* standard.

*E. coli* results for the baseline period show that about a third of the results in Alewife Brook met the state standard for *E. coli*. Both samples at 056 and one sample at 057 did not meet standards – otherwise all locations in the Upper Mystic and Lower Mystic Basin met the standard during August 27-28.

After the storm, all locations on August 29 showed significant increases. As expected, Alewife Brook locations were among the highest, with station 308 being the highest and station 277 the second highest. 277 is upstream of CAM401B and SOM001A, both of which discharged in this storm. Counts decreased along the length of Alewife Brook until station 070 at the mouth, where they increased. Counts increased along the Upper Mystic and Lower Mystic Basin with the lowest counts upstream and the highest downstream, with the exception of the station 167 on the freshwater side of the Amelia Earhart dam, which had the second lowest results in the basin (station 083 was the lowest). Much like *Enterococcus*, the Malden River station (176) showed very high counts, comparable to those seen in the Alewife.

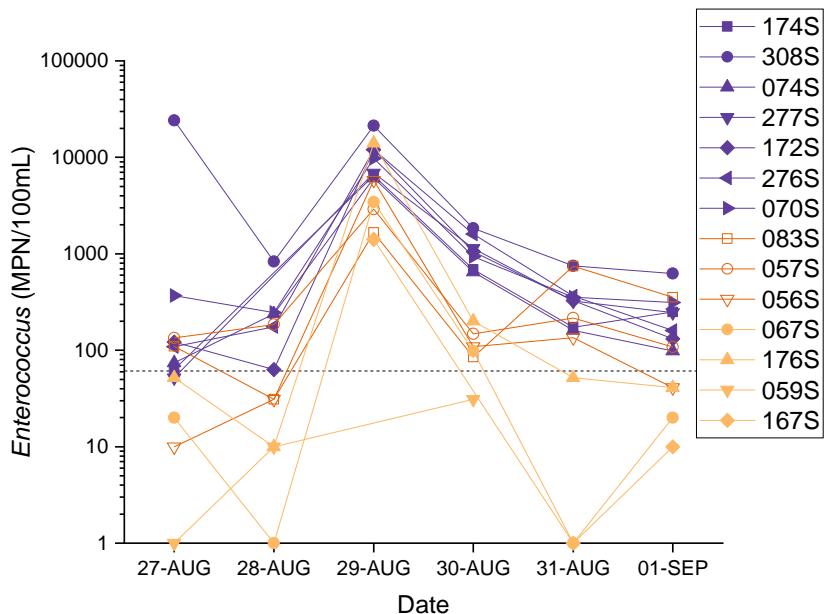

There was a general trend towards decreasing counts all along the Alewife Brook and Mystic River on August 30, with the exception of stations 172 and 276 in the Alewife Brook, which saw small increases. Despite the general downward trend, no locations met state standards. August 31 and September 1 unfortunately saw a general trend of counts leveling off – two of fourteen stations met state standards on August 31, while half of them did on September 1. Spatially, 083 and 067 met standards on August 31, and all stations in Upper Mystic and Lower Mystic Basin except 083 met standards on September 1, as did 172 in the Alewife Brook. There was a noticeable increase at station 308 on September 1, but as noted previously, this station shows very high bacteria counts in all rainfall conditions.

**Table 5-7. Rainfall Characteristics for August 28, 2019 Storm.**

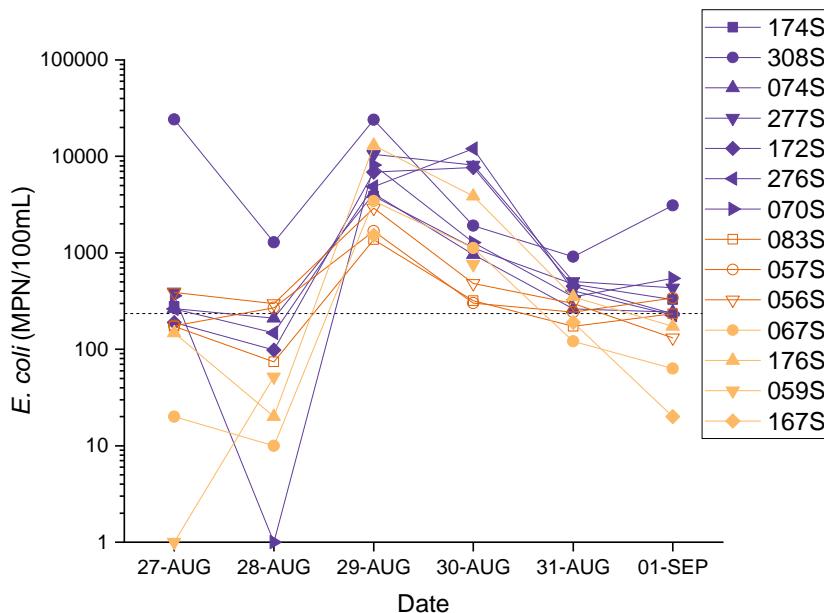

Gauge	Storm Start (Aug 28, EST)	Storm End (Aug 29, EST)	Duration (hrs)	Total Rainfall (in)	Peak Intensity (in/15 min)	Peak Intensity (in/hr)
Somerville Marginal (MWRA)	15:15	01:15	10.25	1.32	0.34	0.7
Charlestown (BWSC)	15:15	03:00	11.75	1.13	0.36	0.6
Fresh Pond (USGS)	14:45	01:00	10.25	1.37	0.21	0.6

**Table 5-8. CSO Discharges in the August 28, 2019 Storm from the MWRA calibrated hydraulic model.**

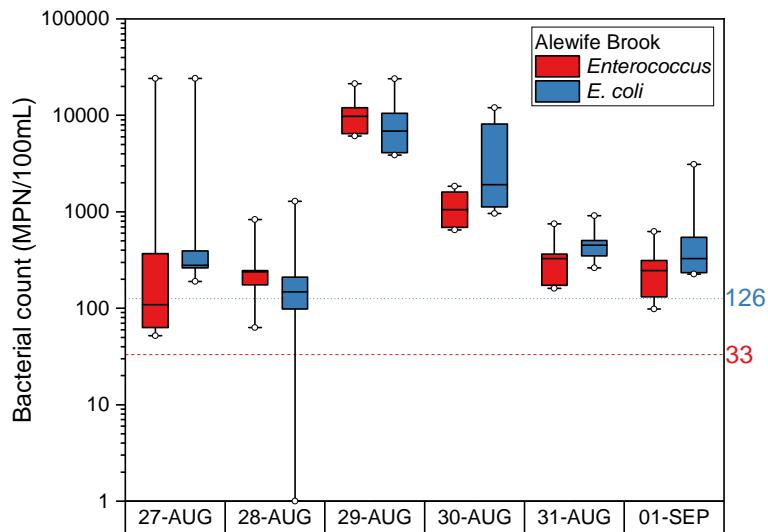

Outfall	Discharge Date/Time	Duration (hrs:min)	Volume (MG)	Notes
CAM401A	8/28 23:49	0:49	0.327	
CAM401B	8/28 23:47	0:42	0.0608	
SOM001A	8/28 0:04	0:26	0.301	
MWR205A (Somerville Marginal)	8/29 00:50	0:40	n/a	Treated, upstream of Amelia Earhart dam. Level sensor only, no volume available. Duration data from facility meter.

**Figure 5-15. Alewife Brook and Mystic River *Enterococcus* counts, August 27-September 1, 2019.**  
Time series of *Enterococcus* counts before and after the August 28 storm. Dashed line is the MADEP single sample standard of 61 MPN/100mL.

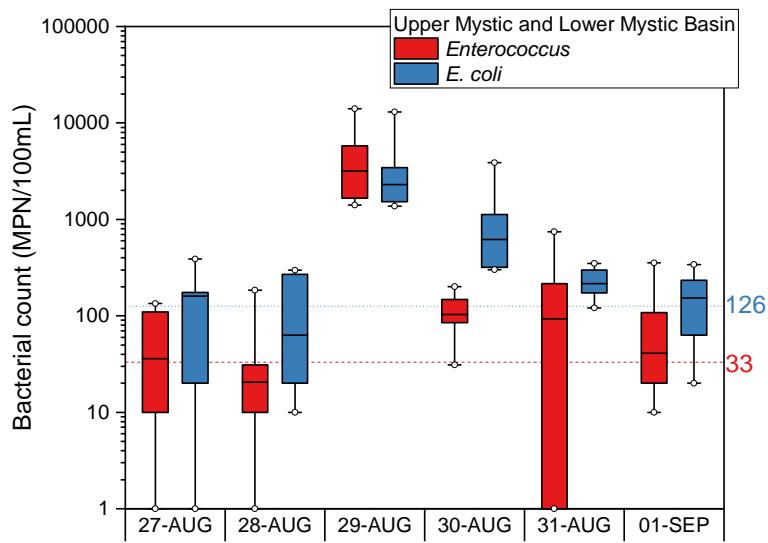

**Figure 5-16. Alewife Brook and Mystic River *E. coli* counts, August 27-September 1, 2019.**  
Time series of *E. coli* counts before and after the August 28 storm. Dashed line is the MADEP single sample standard of 235 MPN/100mL.

**Figure 5-17. Alewife Brook bacteria samples by date, August 27-September 1, 2019.**

Distribution plot of bacteria samples in Alewife Brook (both *Enterococcus* and *E. coli*) collected before and after the August 28 storm. The dotted line shows the MADEP *Enterococcus* geometric mean standard and the dashed line the *E. coli* geometric mean standard.

**Figure 5-18. Mystic River bacteria samples by date, August 27-September 1, 2019.**

Distribution plot of bacteria samples in the Upper Mystic and Lower Mystic Basin (both *Enterococcus* and *E. coli*) collected before and after the August 28 storm. The dotted line shows the MADEP *Enterococcus* geometric mean standard and the dashed line the *E. coli* geometric mean standard.

### **5.2.2.2 November 19, 2019**

In the 24 hours between roughly noon on November 18 and noon on November 19, there was a moderate, long duration rain event that measured around half an inch of rain. Rainfall intensity was low. Table 5-9 summarizes this storm. There was also a small storm on November 20, primarily after the sampling that morning. The characteristics of that storm are in Table 5-10. Additionally, at the end of the sampling period, there was a very small rain event (0.01 inches) measured at the Fresh Pond and Somerville Marginal gauges in the early morning. This event is not in a table.

According to the MWRA's calibrated hydraulic model and facility meter data, there were no CSO discharges between November 18 and November 22. Therefore, any water quality impacts are from non-CSO sources.

The biweekly nutrient survey captured some baseline data on November 18 for *Enterococcus*, shown in Figure 5-18. All the baseline data was in the Upper Mystic and Lower Mystic Basin. All locations met the state standard except for 066 in the Upper Mystic. Samples collected on November 19 were high, indicating wet weather influence from the rain that started the previous day. Counts were high all along the Alewife Brook, which is the highest counts at stations 276 and 074. No locations met standards. Of the six locations in the Upper Mystic and Lower Mystic Basin, only two (both in the Lower Mystic Basin) met the standard. Spatially, the Upper Mystic results were lower than the Alewife Brook results, but higher than results in the Lower Mystic Basin.

Sampling on November 20 may have been impacted by the rain – the Fresh Pond gauge has the rain starting as early as 7:15 AM. Regardless of the timing, there seems to have been minimal impact as counts decreased from the previous day at all but two locations – 057 and 176. On November 21, counts continued to decline at all but three locations – 308, 056, and 067. 308, as noted above, is a location with high counts in all weather conditions. 056 is a location that is well downstream of any CSOs, yet can show high bacteria counts in wet weather. 067 is near the MWR205A outfall. While there were no CSOs at the Somerville Marginal CSO facility, stormwater does enter the facility discharge conduit downstream of the facility. The latter two locations could have been affected by the rainfall on November 20 which ended the previous evening. By November 22, seven of the thirteen sampling locations met the standard, with half of those that did not meet in the Lower Mystic Basin, including small increases in the Malden River (176) and at the Amelia Earhart Dam (167).

*E. coli* results (Figure 5-19) showed similar trends to the *Enterococcus* data. November 18 baseline data met the state standard at all but station 177. None of the November 19 samples in the Alewife Brook met the standard, although only station 057 did not meet the standard in the Upper Mystic and Lower Mystic Basin.

Results on November 20 showed decreases at all Alewife Brook locations but increases at two-thirds of the stations in the Upper Mystic and Lower Mystic Basin, including a large increase in station 176 in the Malden River. Only station 057 (the Alewife Brook/Mystic River confluence) and 167 (upstream of the Amelia Earhart Dam) showed decreases. On November 21, four of the seven Alewife Brook locations saw counts decrease, while most locations in the Upper Mystic and Lower Mystic Basin also saw decreases. Counts at stations 056 and 067 increased, perhaps due to the rain the previous day as

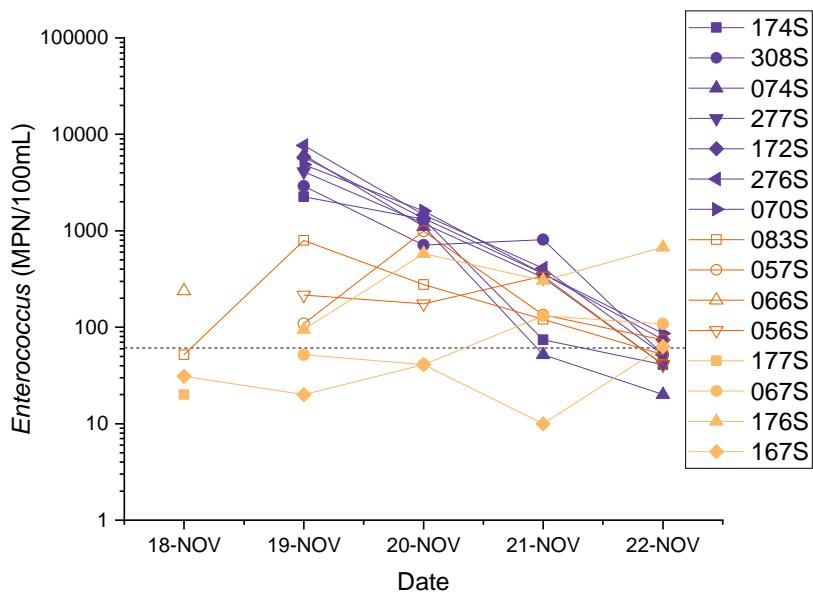

mentioned above. Counts at station 167 also increased, although the standard was still met at this location. At the end of the sampling period, November 22, only two of the Alewife Brook stations met the standard, while in the remainder of the river, only one location did not meet the standard (056).

**Table 5-9. Rainfall Characteristics for November 18, 2019 Storm.**

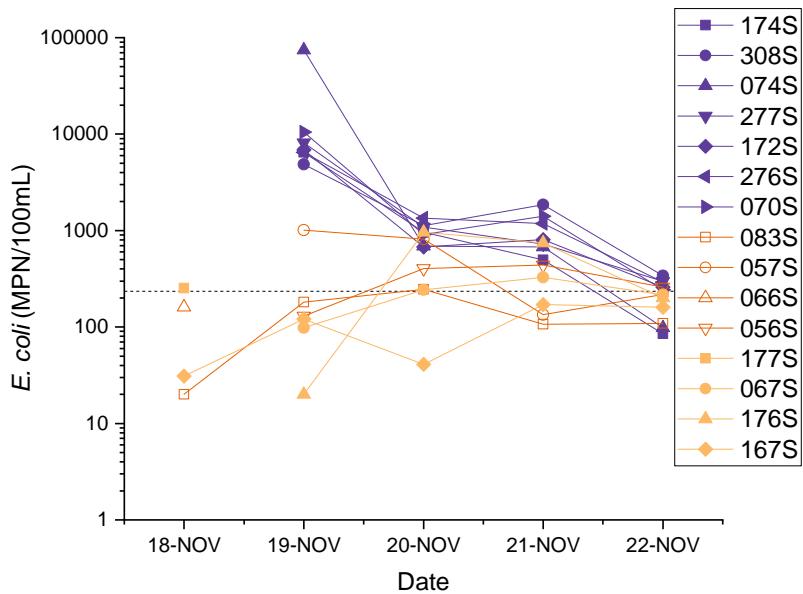

Gauge	Storm Start (Nov 18, EST)	Storm End (Nov 19, EST)	Duration (hrs)	Total Rainfall (in)	Peak Intensity (in/15 min)	Peak Intensity (in/hr)

## **Appendix II: Use of Local Rain Gauge Data for Rainfall Categorization**

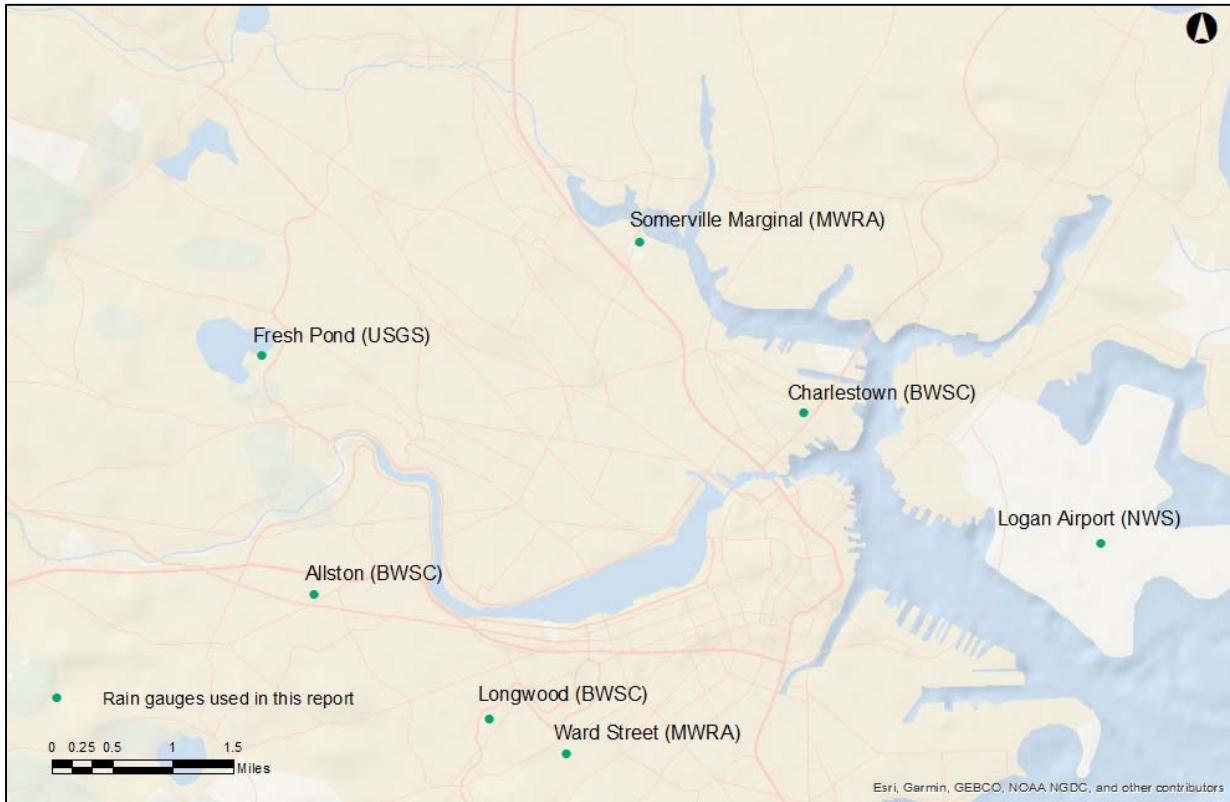

Numerous earlier figures in this report use rainfall categories of Dry/Damp/Wet or Dry/Damp/Light Rain/Heavy Rain (e.g., Figure 3-5, etc.). In past reports, these categories have been based on daily rainfall data collected at the NOAA rain gauge at Logan Airport, which depending on the spatial characteristics of a specific storm, may or may not give an accurate picture of the total rainfall amount in a certain area. As CSO activations are heavily influenced by rainfall in the area “served” by the CSO, MADEP requested that more localized rainfall data be used by MWRA.

For this report, all rainfall conditions (with several exceptions, see below) are calculated from the rain gauge most local to the sampling station. The pairings of local rain gauges with sampling locations is below in Table 6-1. These local rain gauges are maintained by MWRA, BWSC, and USGS (Figure 6-1). These are the same gauges used by the MWRA’s Infoworks sewer system hydraulic model. These gauges report not only rainfall depth, but also rainfall intensity, generally in 15 minute intervals. Due to the greater temporal resolution of the local rain gauges compared to the Logan gauge, antecedent rainfall can be calculated precisely 24, 48, or 72 hours (or, if needed, any arbitrary number) prior to the exact sample collection time.

The only exceptions to the use of local rain gauges are Figures 3-7, 3-8, 4-9, and 4-10, which present data dating back to 1989. As the Logan rain gauge is the only gauge available with a complete data set for the entirety of the period, for consistency the rainfall conditions on those plots are calculated using the Logan rain gauge data for 1989 to present.
